S K E T C H
OF THE
ESQUIMAUX FOUND IN THE TERRITORY OF
BOOTHIA FELIX.

AS it has appeared to many of my readers, that the account I have given of the natives of Boothia in the Narrative of my Voyage was more limited than it ought, or would have been, had circumstances permitted—and that correct portraits displaying their features and dress—which I could not afford to give at greater length in the narrative would be acceptable in this portion of the work, I have commenced it, in the first place with a general sketch, and secondly with the individual description and history to accompany and explain each of the drawings.

I need not dwell much on their manners and customs, nor enter into any great details respecting their arts and inventions; since I could add little to what is already well known, and need not repeat what can be found in many books. As to their personal appearance, including, with their stature, forms,

and physiognomy, their dresses, it so accurately resembles that of the other tribes of Esquimaux so often described, that I may almost pass it over, while referring to the different plates in this volume, and their accompanying explanations.

I had abundant reason, in the first place, to believe that the natives of this spot, uniting with these a few with whom we had but a temporary and slender communication, were entirely unacquainted with Europeans: while the nearest approach to any knowledge of them was, to have conversed with some one who had conversed with a third person who had seen them at Igloolik, and, possibly, elsewhere. Nor was this contradicted by their possession of a few European knives. Of these, they had indeed but three: nor did those on which the maker's mark could be traced, permit our believing that they had been obtained from Sir Edward Parry. In reality, they admitted themselves to have possessed those for a "very long time," while unable to explain whence they had been obtained; so that no conclusions of any kind could be drawn from this circumstance.

Thus ignorant of civilized society, they were equally unacquainted with the warlike tribes of America; whether those of their own race, or the races which are included under the general term Indians. The peculiar insulation of the tract to which they confine themselves, is not only the cause of this, but is likely to operate henceforward, without interruption. While that tract is sufficient to give room for their summer and winter migrations, it supplies all their wants, and therefore leaves them no temptation to wander eastward, where they might possibly hereafter

come into contact with Europeans: while the nature of the country surrounding the isthmus which divides them from the larger mass of the continent of America, together with that of the country which must be traversed to reach this, as effectually precludes the visits of the Indians and the western Esquimaux, as it checks any desire on their parts to roam beyond their present limits.

Excepting, therefore, the people whom I found in 1818, and whom I termed Arctic Highlanders, the natives of this spot form the narrowest and most insulated tribe of men that has yet been discovered by navigators: a fact which gives interest to whatever their characters may present. Here, if any where, we ought therefore to find how the human mind is developed under the narrowest education, in what manner the “light of nature” as it is termed, operates on the moral character and conduct, and how far human reason can proceed, under the smallest possible quantity of materials to act on, and under a very narrow range of application. If also there are peculiarities of character, whether for good or evil, the moralist and metaphysician may here speculate on what belongs to the original mental constitution of these people, and what is derived from their narrow and limited intercourse with their own species, in a society so restricted in numbers, and so incapable of changing customs or altering habits, where there is nothing beyond themselves to see, and no one to imitate.

Whatever species of purity this may imply, the vices which they possess must, like their virtues, be those that originate

among themselves: the natural produce of the human passions, acting where there is no control from religion, from the belief of an omnipotent Creator and Governor; and where checked, subject to none but those checks which the mutual convenience of the society renders necessary. It is at least certain that they had never possessed the opportunity of acquiring the vices of civilization when we first knew them; but I cannot confidently affirm that they learned no evil from us.

If the fondness of the Esquimaux race for their children has been noted by those who have preceded us in these regions, it is a portion of their character which has been amply confirmed by our own observations on the present tribe. The testimonies of this never failed; nor could they be flattered and gratified more than by the attentions and caresses bestowed by us on their offspring. It equally confirms prior observations to say, that we never saw any chastisement administered, nor ever witnessed even harsh language to them; while, in return, the children are affectionate, attached, and obedient. To say more on this subject would indeed be but to repeat what has already been noticed by Captain Lyon, in many instances, in his account of other tribes.

But there was one material point in which I must differ from my predecessors: though indeed I cannot call this differing, since each of us can but note what he has seen. It only follows, that from some cause, which neither I, nor they, I imagine, can assign, the people of this district differ in a very material point of character from those with whom they were so well acquainted; as

the superiority, in a very high degree, lies with those whose feelings and practices we had occasion to study. The facts, on both sides, were noted; and though I should not make the deductions myself, they could be made by any reader.

It cannot be forgotten, by those who have interested themselves in the history of the people of Igloolik, that the aged parent was neglected, and that the helpless or widowed females in particular, were not simply suffered to starve, but robbed of their little property. We had not the means of studying a very numerous tribe, and, of course, many facts could not have come under our notice; but, such as they were, they could not have been exceptions, since they seemed consistent with the whole feelings and course of the community, and may, therefore, be safely taken as instances of general character and practice. Not to name mere instances, we found the aged Illiktu drawn on a sledge by his companions, when the old man above alluded to was suffered to walk as he best could; as was equally the case with Tulluahi, whom we supplied with a wooden leg to replace his loss. If the ancient wife of the former was as well clothed and fed as any of the rest of the tribe, it was more remarkable to find two old and destitute females in the same good condition, and as well taken care of in every manner as if they were still of use.

If this feature of their character removes from these people that charge of most disgusting selfishness and inhumanity which rests with so much justice on those of Igloolik, according to the published accounts, I need but notice, that there exists here the

same custom of adoption as in that tribe, with the same consequences and practices, on both sides. If there was aught of difference, in any respect, it did not fall under our cognizance.

I do not know that there were any differences between the state of the connubial relations and practices in this place and at Igloodik, or wherever else these have been remarked; while there has been a little obscurity in some of the accounts of this subject. It is my business, at any rate, to relate what came to our knowledge.

A state of celibacy is unknown: the mere supposition of such a condition is treated as a chimera, nor did they know how to believe that any of us could be without wives. Every woman therefore finds a husband, as every man procures a wife: but, often, inevitably, under a system of polygamy; since the sexes cannot always be equal in numbers. The rule also appears to be, if it be not rather a natural arrangement than a law, that the most expert hunters obtain the superfluous women, as best able to maintain them; though we did not know of any instance of a man possessing more than two wives; of which the first, or eldest, is the senior in command and respect. In the same way, it is the strongest or most useful woman who most readily obtains a second husband: while, under either mode of this polygamy, or, possibly, only bigamy, the most perfect harmony seems always to subsist among the parties. If, never witnessing any angry word between husband and wife, and seeing each for ever treating the other with indulgence and frankness, we were willing to conclude that these people had attained that perfection

of domestic happiness which is so rarely found any where, it is a conclusion, I fear, that reflection would not justify, and that a more intimate experience perhaps would not have confirmed.

The forms of matrimony seemed here not to differ from what has been observed in other tribes of the Esquimaux, excepting that the young female must make her choice as soon as she is marriageable—but, the contract, such as it is, is settled between the parents for their children, and often at a very early age: the time of marriage seems to be about the age of fifteen; and there is no other form but that of the female going to the hut of her destined husband.

I believe that the practice of repudiation and change, whether of husbands or wives, has been found in all the Esquimaux who have come under the notice of navigators. Be that as it may, it is the custom in this district, though it was not easy to trace the extent to which it is carried. How far it may depend on satiety or disagreement, we could not discover, or on the desire of change, or on more improper feelings, on either side: but where the morals and the feelings are both so extremely lax on this subject as we found them, it would be an idle and silly defence of this or any other mode of the savage condition, to suppose that vice, or what at least we must consider such, was a frequent source of this practice. It has been the custom, on one side, to overrate the virtues of savage nations, and, on the other, to exaggerate their vices. These things must be left to the novelist, and to the navigator who desires to emulate him, for the sake of producing an effect; to the false philanthropist and the lover of

paradox ; and to him whose temper may have been soured by such collision, or who may have commenced with a prejudice distorting all that he saw. But the passions of our nature will strive to break forth, under all the restraints that society and religion can impose ; and how should they not actually reign, where there is neither to check their operation, where there is nothing to say, This is wrong ; still more, where there is no inconvenience contemplated, to balance that which is gratifying, and may also be convenient ?

But if there is no vice where there are no religion and no moral law to say, This is disobedience to God, and where custom and admission say that no injury is committed against our fellow-creatures, then is there also no vice in that want of chastity which is as remarkable here as it has been found among all the scattered tribes of the Esquimaux on the American shores. Who is there among the moralists to settle this question ? Be it determined as it may, that “ moral sense ” on this subject, which is so generally diffused, is here deficient ; since it is grossly unjust to attribute to selfishness alone, the respect entertained for chastity in the female sex ; in whatever manner the value of this in the other is judged of. The Esquimaux of Igloodik, at least, are proved to be in the last degree selfish : yet the virtue in question is held, by them, in no repute.

We at least must speak as we, under civilization, feel. The conduct of the present people, as of all the rest of this race, is not more pure than that of the brute beasts : it is far less so than that of the pairing animals. But I need not dwell on a disgusting

and improper subject : it has been told once ; and it must suffice that it has been once told.

If I have already noticed the custom of adoption, I need not dwell on it: the reasons are the expected services from the subsidiary child : and the new attachment, on both sides, is equal to that between the natural parent and progeny. Thus also it is, that the widow with children, most especially if those are boys, becomes a prize, be her age what it may compared to that of the suitor ; since these become equally the property of the husband and bound to support both.

Respecting their treatment of dead relations, or of the dead in general, we had a good opportunity of judging ; as two deaths occurred within our experience. Illictu, the old man, was long left in the hut where he died, and would have been devoured by foxes and bears, had we not interred his remains. The incision found in his abdomen was unquestionably made after death : but we never learned its purpose, and could not conjecture whether it was a superstitious practice. The boy who had been killed by a stone was not found, and we were ignorant what became of him. But as we observed many graves in different places, it is evident that those who formerly inhabited this country conformed, in this, to those of other tribes. On his death, there was an appearance of much despair, ending in anger directed toward us : but we had reason to understand that their lamentations for death, though severe, were soon over, nor could we hear of any ceremonies used on this occasion or on that of a funeral.

The selfishness of this race, as known to Sir Edward Parry, cannot be more strongly marked than he has done it in his description of his intercourse with them. It admits of no dispute : yet such was not the character of the present tribe. I have already said that they paid as much attention to the aged and destitute as could have been done by any civilized people : and we had opportunities of observing, that so far from seeking the exclusive gratification of their own hunger or appetites, (the ever ready and most marked test of animal selfishness,) they were always ready to divide their provisions, even where they had not enough for the next day, with those who were in want.

The striking and most repulsive want of gratitude in those who came under the cognizance of that observer, was certainly not evinced by the present tribe. So far from this, our experience led us to assign them a character the very reverse : though the virtue of gratitude, if it be practically esteemed a virtue, as men may safely doubt, is not so very abounding or so much cultivated, even under civilization and the lights of morals and religion, as to have led to any great censure of these people had they been without it. If those against whom the charge of ingratitude has been, and with unquestionable justice, brought, are what men ought not to be, there is that to be recollected, which, though not an exculpation, forms a solution of an imagined difficulty, which has possibly been overlooked : in civilized society, it is acknowledged and admitted that ingratitude is a vice : but it is a profitable or an advantageous one, and, while practised as such, it becomes

necessary to conceal or suppress, as far as that is possible, the open and shameless display. The "children of nature," as they are, customarily, though very idly termed, go direct to the mark which others reach in a more circuitous and hidden manner: there is no check, from opinion, or usage, or morality: it is a convenient or profitable usage, and the shortest road to the desired end is taken. Where the extreme of self-love forms the basis of a character, whether it be that of a whole tribe at Igloodik, or of an individual in England, ingratitude becomes an affair of course: it is a portion of the same virtue, where it is the custom to consider selfishness as the most needful of those, and thus, under such a code of brute morality, the most laudable.

Be the fact as it may, however, as far as these general views are concerned, we must have been egregiously deceived, or, possibly, have contributed to our own deception, if the tribe of our acquaintance, here, did not display as much gratitude as could have been expected any where, if they did not impress us with the conviction that this formed a portion of a character which appeared in general so amiable, or, at the very least, so unexceptionable.

It is not only, that, far exceeding the usual short and dry form of thanks, so general among this race, they seemed truly sensible of the favours conferred; but the impression was found to remain. The thanks were renewed long after the services had been rendered, and when, according to the common course of things, these should have been forgotten; while they were often

accompanied by a free gift of some kind. It is but a part of the same character, that they were ever ready to confess a fault, and to make reparation, as they best could, either by apology, or restoration, or services; while ever seeming uneasy till they were forgiven and restored to favour.

I may indulge in relating one petty history, by which this part of their character will be better illustrated than by any general statements, and I have no right to consider it the exception, rather than the rule, where no similar opportunity offered; since it seemed to be consistent with their general character; and in other points than this.

It had been settled, early in the spring, that Ooblooria and Awack, the son and nephew of Ikmallik, should provide themselves with a sledge, dogs, and provisions, and accompany Commander Ross, who was to furnish his own supplies and carriage, and to proceed to Neitchillee, about fifty miles off, under their guidance. They accordingly came, at the appointed time, which was fixed by counting on the fingers, and by drawing on the snow the appearance which the moon would then present; the stipulated quota of provisions being for five days.

On arriving, however, they found that four families, including some relations, were hutted near the ship, and had been unsuccessful in their hunting; on which they unpacked their sledges, and gave up so much of their stores as only to leave themselves enough for two days. This was barely sufficient to carry them on to Neitchillee, yet not enough to maintain them during their return; but they had expected to find a deposit of fish at that place. Unluckily, a storm

of snow detained the whole party; and, in the calculated time, the provisions of the guides were exhausted. The needful supply was therefore given them from our own stores, which they promised to replace on their arrival at Neitchillee.

Here, however, when they at length arrived, their deposits could not be found, from the mass of snow by which they had been overwhelmed; in consequence of which they were again supplied with food enough to enable them to return to the ship. Here they related all that had been done for them, with the strongest expressions of gratitude; adding that their parents would come and thank Commander Ross, when he returned, for the kindness which he had shown. This was done on the next day, by our furnishing the means of that journey after we had accommodated them on board for the night; when the father and mother arrived with a present of seal-skins of the best quality, and an offer to make them up into the water-proof boots for which they were intended; while they seemed exceedingly pleased that we accepted them without offering any remuneration. In a few days they returned with the manufactured articles; nor did their gratitude end even then, since it was often expressed afterwards, and, even at the distance of four months, with a promise of a similar pair when the ship should arrive at Neitchillee.

If the Esquimaux race has often been noted for cheerfulness and good temper, we found that confirmed here. Under the latter quality, if kind in their domestic relations, as I formerly noticed, so were they to their dogs; unlike to many of their fraternity, who have been noticed for their ill-treatment of these useful animals.

That these dogs were in bad training, was a natural consequence. Their cheerfulness was often vivacity, so that we might consider them a lighthearted people; and they seemed to possess great command of temper. The only show of resentment for what was thought an offence, was silence, after which they commonly left us and returned to their homes.

The thievish propensities of savage nations are familiar: there is not a voyager's narrative which does not dwell on them; and such excuses or defences have been made as these narrators could best contrive. I need not repeat the satirical defence which asks, what civilized Europeans, under equal temptations, and no restraints from divine or human laws, would act in a different manner. It seems a very simple question after all. Here, at least, whatever it may be elsewhere, there is no written divine law against theft, nor does there appear to be any moral sense which says that it is, abstractedly, and universally, wrong. Human laws there are none; and there can therefore be no check but that of the inconvenience: as some modern pedants write, they are governed by the principle of utility. But while there is much convenience in acquiring the coveted property, there is no counterbalancing evil: the society suffers nothing, while many or all may gain. The case of a wreck on our own shores is not essentially different: the resemblance to an enemy's town subjected to plunder is still more perfect. The thefts of savages are a warfare on property which seems placed in their power; it has been open warfare and bloodshed whenever they have dared; and when too feeble, it is such plunder as is attainable, without hazard, and by whatever dexterity. That

such is the principle by which they are guided in this case of theft, seems indeed fully proved by the fact that they do not rob each other; the evil in such a case would be felt and remedied.

The reasoning of these Esquimaux, however, seemed of a different nature, and of a more "liberal" character: it has often been used in far other lands, and has been considerably acceptable to the multitude, before the days of Wat Tyler and since; as it is a rule of action for him who pilfers a book from a library or a rare shell from a cabinet. Not only are the sea and the land, with the animals which they bear, the common property of those who want them, but the same is true of every thing which can be found on the face of the earth. It is the want alone, therefore, with the power of using, which constitutes the right to possession: but it is a corollary from the general argument, which might not be so acceptable to those who use it among ourselves, under which they restore the stolen article when they find the original owner to be in want of it.

In this manner did they practically conduct themselves toward us. No secret was made of the theft among themselves, so that the knowledge soon came to the owner, to whom the stolen article was returned on demanding it. Nor were the accusation, and the term thief, more than a matter of merriment: though after we had taken some trouble to explain to them that to steal was "bad," very few instances of a similar nature occurred. In one case, the husband, aware of his wife's propensities, always brought back what she had taken away.

The extremely envious disposition of some of the Esquimaux has

been noticed, among their other faults. I must not be quite sure that we were not inclined to see every thing here in the most favourable light: but while admitting that every man wished to possess, by purchase, whatever his neighbour had obtained, we did not observe any workings of that bad passion in this desire.

We did not observe any propensity to falsehood, or disposition to deceive; and, on every occasion, there seemed a desire to communicate all the information in their power, while, as far as we examined, this also proved correct. It was on the same principle, that we could always trust their promises; there was the "point of honour" engaged; and on the only occasion on which they broke one, in not keeping an appointment as guides, they long after accused themselves of "being very bad" for not giving notice; though, to have done so, would have been to lose a day of their hunting when they were without provisions.

Such is the little we could discover or infer respecting the moral character of these people. It ought not to be an unexpected one, considering the mild dispositions of this race in general, and the circumstances in which they are placed in this narrow community and district. May I not say that it is a good one, and that the man of these lands may be considered a "virtuous savage?" May I ask where are the civilized communities in which there is a more favourable balance of the vices and virtues? since it is thus, and not by the varied action of either, that this question must be judged. This at least I may say, that the all-wise and beneficent Creator has not neglected this race, and that in giving them the means of animal happiness united to the desires which prefer those means to

all others, he has also, in his own way, instilled into them such principles as tend to preserve their moral happiness and order: while it is not for man to say in what manner he will hereafter judge those who have obeyed the impulses to good, and those who have indulged the propensities to evil.

But, of Him, they have no knowledge; in this they resemble all their unconverted brethren of the same great tribe; while I need not repeat the remarks so often made on this subject. Like others, we found nothing that even approximated to this wide-spread piece of knowledge; and could only conclude that their opinions respecting a future state coincided with those which prevail among the Esquimaux at large. If they were influenced by any superstitions which have a reference to a Providence or a future life, we did not discover them: and though possessing an *angekok*, like all the others, he did not seem to be treated with much deference or any respect.

We discovered in them a strong propensity to imitation and to mimicry: a property which they converted to immediate use, in learning to feed themselves in the same manner as we did, and with the same utensils; and under which also they sometimes amused themselves in aping our gait and manners: above all, in the English custom of uselessly walking up and down under the notion of exercise: a practice which they could as little comprehend as the Orientals, to whom it is so often a subject of wonder.

This principle extended also to drawing, in which, even with our pencils, they were speedily proficient: while further rendering this talent very useful to us, in delineating the geography of the country; as has been found equally common in the other tribes of

these people. All their geographical knowledge seemed very accurate; and, to every river, hill, bay, or lake, there was a name: while it seemed to give them great pleasure to be able to communicate this information.

Notwithstanding the vanity which made them prefer whatever was there own, despising, or affecting to despise, even our guns, in comparison with their own weapons, they were very desirous to know the name and use of every thing; nor had we any difficulty in making them comprehend the latter, in spite of our ignorance of their language. I must, in reality, consider them as an acute-minded people, who would be ready, after a little while, to receive instruction, and probably to adopt some inventions, and customs also, as far as these could be admissible under the circumstances in which they are placed.

Of their intellectual faculties, beyond these points, it is difficult to form any judgment, so limited is the scope for the exertion of those; nor can I refer to aught more than their dexterity in hunting, and the practice of those useful arts which I shall immediately notice. But they are an energetic and active people; and though given to great excess in eating, like all others of their race, never appearing to give way to pure indolence, even when well fed. On the contrary, they seemed always busied in something, even when at home: as some of us were inclined to think that much of their eating arose rather from the necessity of doing something than from appetite.

In procuring their food, they seemed also more provident and systematic than the Esquimaux have generally been found.

Nothing can be more regular and orderly than their migrations from one place to another, in pursuit of the different kinds of game; while their system of storing up provisions, and oil for fuel, in different places, to meet future wants, seemed as perfect as possible. These are prepared in advance, at the several stations where the musk ox, the reindeer, and the seal are to be hunted; and thus they can undertake their furthest migrations with the most perfect security.

No one expects to hear that they are a more cleanly people than their fraternity elsewhere, and I need not repeat the disgusting details. Man is permitted to be more dirty than the beasts, and he is certainly not slow in taking advantage of this privilege wherever he dares. But, here there is really some excuse, and the people were not unwilling to be clean. They cannot well avoid contamination from the oil which they use as food and fuel; as, in a confined hut, where every thing must be dried at the flame of the lamp, the effects of smoke are equally inevitable. But the excuse, above all, is the want of water; and it has been resorted to as an excuse for similar neglect where it is not the rare and expensive article which it is here. The expenditure of fuel required to thaw what they drink is very great, as the quantity of water which they thus consume is enormous; very often they cannot procure enough, or suffer severely from thirst should their oil be expended: so that we need not be surprised if they do not wash themselves in winter: while the habit of ten months in every year of life can scarcely be broken through in the two short ones during which water can be procured.

Yet they wash their faces at least, by using a piece of wetted bear-skin as a towel; while they were well pleased to be put into good order on board, even to the act of combing and cutting their hair, and the loss of their beards under the barber's hands. The hair of the men is indeed kept quite short, being an evident improvement of their appearance as compared with the long-haired tribes, as well as a decided peculiarity: it is the women alone who wear it long, and tied into two bundles, or long cues, hanging over the two shoulders.

They seem little addicted to ornaments, and were very indifferent to our beads; it was on the children almost solely that these were placed: while their own consisting of fringes of skin, teeth, and other things, were similar to those which have often been described.

Their dresses being shown in plates and described in the explanations, I may omit any notice of those, as of many other matters. As elsewhere, the outer dress is always taken off and cleared of snow on entering the huts, altering their appearance in such a manner that they can scarcely be recognised. The snow sofas on which they sleep have no covering of branches, as is common elsewhere: the first layer is that of seal-skins, above which are deer-skins with the hair uppermost, being the sheet or blanket; while a similar skin forms the coverlet. In what manner they sleep, I need not repeat; and the beds are not cold, except in very severe weather, though the temperature of the walls cannot be above the freezing point. The lamp is ever burning; since it is the fire for cooking when not required as light.

Their snow huts have been so particularly described that it is superfluous to speak of them again: while I have also noticed their method of proceeding with the construction in the course of the preceding journal. I need only name what has not yet been mentioned, namely, their method of procuring the ice window, which, in this country, is not to be found on the surface of a pond. For this purpose, a seal-skin is laid on the snow, so managed at the edges that it may contain two inches of water in depth, procured by thawing snow before the lamp. This is immediately frozen into a transparent plate: and such, I presume, is esteemed the value of the fuel used for this purpose, that these windows are always removed and carried with them in their migrations. It is already equally known, that when the roofs of the snow huts begin to melt under the influence of the sun, they are removed, and a covering of skins substituted, as the summer tents consist of skins raised into a conical form by means of a central pole, from which lines are extended, and surrounded at the base by circles of stones.

The walrus does not frequent these straits: and whether it is that the whale is rare or not, we could not understand that they ever took any, and many had never seen one. The seal, the musk ox, the reindeer, the fox, and the hare, form their quadruped game: they kill but few grouse, which, being considered delicacies, are reserved for the women and children; but their supplies of fish seem to be very considerable. This last is eaten raw, if often half dried: the flesh of animals seems acceptable in any way, but it is always cooked, if possible, apparently for the sake of the oil soup.

In the method of taking these several animals, there is nothing which has not been often described. The reindeer are generally shot by arrows, in the water, as is usual elsewhere; and, in their canoes, there is nothing to notice, if I except their manner of ferrying the women and children, by stuffing the latter within the skin of the boat, and making the former lie flat behind her husband; in a rather dangerous position, when the least movement would upset the whole crew.

Under the great scarcity of wood here, since very little is ever drifted on these shores, and in the want of the walrus and the whale, they are almost limited to the use of the reindeer's horn in the making of their spears and other weapons; but these so nearly resemble those noticed by Crantz and others, that I need not describe them, unless indeed the fish-spear be not different from any of which I have read. The shaft of this, seven or eight feet long, is made of wood, if that can be procured; if not, of horn; and is furnished at the end with three points, so as to resemble a trident, of which, the central one is plain, and the two outer barbed, as may be seen by one of the plates.

This want of materials compels them also to adopt a method of constructing their sledges, which differs very materially from all others hitherto described. A number of salmon are packed together into a cylinder about seven feet long, and wrapped up in the skins taken from the canoes, which cease to be of use when the frost is arrived. Being then well corded with thongs, two of these cylinders are pressed into the shape of the runners, and, having been left to freeze, are secured by cross

bars made of the legs of the deer or musk ox, so as to form the bottom of the sledge. This being done, the bottom of the runner is covered with a mixture of mossy earth and water, which soon freezes, to the depth of two inches; after which comes the final process of plating the surface, that it may run smoothly over the snow. The operator takes some water in his mouth, and, when somewhat mixed with saliva, it is deposited on a bear-skin which is then rubbed over the runner, as by a brush, gradually, till a coating of half an inch thick is produced, when the work is finished; the ice produced in this manner having an unusual degree of tenacity, and being also more slippery than the ordinary material.

These carriages travelled much more lightly than our own, which were shod with iron; but as they cease to be of use as soon as the thermometer reaches the freezing point, they are taken to pieces; the fish being eaten, and the skins converted into bags, while the bones are reserved for the dogs. In the preceding journal I have noticed the sledges made of ice.

In their miserable singing there is nothing which has not often been described; and this is equally true of their dances, or rather dance, which seems intended to imitate the motions of a bear.

on acquainting us of his demise. He had four sons who all paid him great attention, and he lived to see his great-grandchildren. He left a widow about ten years younger than himself. On examining his corpse a large but not deep incision was found in the abdomen evidently made long after his death, and probably to prove that he was really dead. The whole of the party left the snow huts at North Hendon, where he died, on the following day, leaving a small piece of wood on the top of the hut, and, after the party had gone out of our reach, his remains were interred by us to prevent its being devoured by foxes. Before leaving Felix Harbour the surgeon procured the skull, which I intended for the Phrenological Society, but which was one of the many valuable specimens of natural history which was of necessity left behind when we abandoned the ship at Victoria Harbour—his eyes were black and very small; his hair, of which I have preserved a specimen, was grey approaching to white, when he died he was corpulent, and seemed to have no disease but old age.

Kanguagiu, his widow, was afterwards found in possession of Poweytak, whose kindness to her, although helpless from infirmity and old age, will appear hereafter. She was certainly above sixty, about the middle size, and rather corpulent, her hair was grey and her face much wrinkled as well as tattooed. She was triply clothed in reindeer-skins, and was never seen out of the hut within which she is represented to be sitting, excepting when the family were removing to another station.

KAWALUA, TIAGASHU, AND ADLURAK.

TIAGASHU was the eldest son of Alictu, and who took particular care of his father; he was five feet six inches and five-eighths high, slender and weaker than the rest, his eyes were very small, and he appeared to be of a mild disposition. He was extremely industrious, and anxious to support his family, which consisted of a wife, three children of his own, and one of hers by a former husband, besides his father: he was not very successful. In May, 1830, he was reduced to absolute starvation, when he was assisted by Ikmallik's party as long as they could, but afterwards by us, for which he was very grateful, but never had it in his power to make a return. He shed tears on his father's death, and seemed anxious that we should refrain from going to the hut where he was left.

Adlurak, his wife, was one of the best looking; she was remarkable for having large eyes, while those of her husband were very small, and she was perfectly aware of the peculiarity she possessed. She was of a lively disposition and was proud of having four children, two of which were still at the breast; for some time she was a daily visiter, and was one of the most honest.

Kawalua was about sixteen years of age, five feet seven inches high, and well made; he had neither father nor mother, but being nephew to Ikmallik, was an inmate with his family. This lad was one of the most inquisitive, and soon became a favourite with us all;

I therefore fixed on him to remain on board, with the intention of teaching him to read; and having on board an Esquimaux bible and the grammar published by Fabricius, I had hoped to make him useful. For this purpose he remained on board, and I began to teach him his letters; but on the second day he came to me and said, that Aglugga had told him that he was not to stay any longer, and nothing could persuade him to remain. My good intentions were therefore completely frustrated, which I had subsequently great reasons to regret. On the second year we met with him several times, and he was always rejoiced to meet us, enumerating at each interview the presents he had received.

ILLECTU AND OTOOGIU.

ARE represented standing at the pool of Shagavoke, where both salmon and reindeer are killed in the autumn; the piles of stones are erected by the natives, for the purpose of preventing the reindeer from passing along the shore when they wish to drive them into the pool. A man or a dog being sent among them make all to appear moving, which alarms the animals and causes them to take the water; where they are attacked and killed by men in canoes.

Otoogiu was five feet three inches and five-eighths high, inclining to corpulency, his face broad; he was always clad in deer-skin jacket and seal-skin trousers. He was called an angekok or conjuror, but no one had any faith in his predictions, which were always a subject of merriment. He was among the first to show a disposition to possess himself of what he saw, and his taking out of my cabin the magnifying lens, which he is represented to be holding in his right hand, gave us a good opportunity of convincing him and his companions of the danger of meddling with what belonged to us—as related in the Narrative. His wife's name was Kuauga, who had two children; she was five feet three inches and a quarter high and rather good looking.

Illectu, the son of Kunaua was a very fine lad about fifteen years of age, five feet six inches high. He was one who accompanied Commander Ross on his expedition to the north. When two musk

oxen were killed on this occasion, he demonstrated that he was very fond of fresh beef, and that he could eat without being satiated for one whole day. We found him on the following year with his father near Cape Lawrence, and very much improved. He had been successful in hunting both reindeer and seals, and supplied me with skins and oil for fuel on the journey in which the Magnetic Pole was discovered.

Otoogiu is represented with the magnifying lens which he had stolen in one hand, and a knife made of bone in the other. Illictu has in one hand a rod made of reindeer's horn, used for probing the depth of the snow, and in the other a fish-hook made of bone, which I purchased of him, and which now is in my possession. When we met him at Padliak, on the following year, he supplied us with about fifteen pounds of excellent venison, for which he was well rewarded. On seeing the surgeon with a swelled face, he ran suddenly to him, blew in his face, and hit him a pat on the face, which we understood afterwards, was a cure for every complaint; and as the surgeon very soon got well after that ceremony, his recovery was entirely attributed to that charm. At that moment he had suspended to his neck a small phial containing an emulsion which the surgeon had given to him six months before, which instead of taking inwardly, as intended, was hung to his neck as a charm.

K U N A N A.

THIS native, both in features and character, differed considerably from the rest; he measured five feet eight inches and five-eighths, was of a robust and healthy appearance; his forehead appeared lower than it really was, from his eyebrows being very much arched; he was the most successful of all the hunters, particularly in killing bears, and he was constantly clad in bear-skins. Illictu, before mentioned, was his son by a first wife, which he had probably *spared* to a friend. By his second wife, which we saw at Cape Lawrence, he had two young children. His hut was almost entirely covered with snow at that time, but he had a large store of seal-oil, reindeer flesh, and salmon, buried under the snow, also skins of every kind; and from him I bought a very large deer-skin, which was my bed during my fatiguing journey from Victoria harbour to Fury beach, and is now in possession of Sir Felix Booth. He informed us that Kablala (a woman who had a club foot, and who was highly respected by all on that account) had been with him, and had departed only a few days before with Tulooah, her husband. Kunana was one of those who gave us many supplies, consequently he was well stored with knives, spear-heads, hooks, &c., which he had received in exchange. On my return from Artists' bay, he convoyed us several miles, pointing out the names of the various capes, rivers, and stations, which we passed, and

and kindly directed us to the best route to Cape Isabella and Padliak. His wife Nangiak seldom came to the ship, and never without her husband. As they were the most successful, they were never in want, nor were they at all covetous or inclined to pilfer. Her stature was four feet nine inches and one-eighth, her complexion like that of her husband, lighter than the others, and her appearance healthy. She had two young children besides Illictu, and the family were always thankful for what was given them.

HIBLUNA.

(Owhee.)

HIBLUNA was remarkable for being the plainest-looking woman in the whole tribe, and also for being the most lively; when a present was made to her of any useful article, such as a tin preserved meat case, her joy knew no bounds. Above, she is represented in one of her ecstasies on receiving a woman's knife which she holds in her right hand, and in her left a bone knife, while she is jumping up and exclaiming, *Owhee! Owhee!* by which name she was soon known to the sailors. On this occasion, she had brought us a fine piece of a musk ox in a frozen state, and which we found to be most excellent food. She was one of our daily visitors, having with her an infant which she used to produce quite naked, even when the thermometer was 43° below zero of Fahrenheit. Her height was five feet three inches and a quarter, was near forty years of age, and extremely dirty and badly clothed; her face was broad, her nose flat, and the want of her fore teeth, added to her unseemly appearance; her husband's name was Kunana (2d), and she had two young children; however she was so good humoured and merry that she was a favourite among the sailors.

Eringahriu, Hibluna's sister, was so extremely like her, that when they were apart it was difficult to discern which was which; but when together it was more easy, as the former was only four

feet ten inches high. She had also lost her front teeth, and in habit and appearance was equally disgusting. Her husband's name was Ootoonina, who being as ill-looking as herself was an excellent match. They were both our guides and companions during our journey in 1831 across the lakes to the western sea. She was also of a lively disposition, and the sailors, who could not pronounce her name, christened her *Nancy*, to which she answered with perfect readiness; and was likewise a favourite with the sailors. Her husband was a very successful fisherman, and they had always plenty; but she seemed to be a very bad housekeeper, and was not so industrious as the rest, and was never neatly dressed or clean. One of her children was at the breast, and the other was about five years old, which in the summer ran about naked.

MANELLIA AND ADELIK.

MANELLIA was the wife of Nullungiak, and one of the prettiest of the females; her stature was only four feet seven inches and a half; her features were small and regular, and her hands and feet were in proportion, very little; and she was, notwithstanding her dirtiness, rather interesting. She is represented in the plate with a child on her back, which was born at North Hendon, but which died on the following year. Her manner was much milder than the rest, nor did she appear to covet what she saw.

Adelik is an old woman who was a daily visitor to the ship. She appeared to observe with great attention every occurrence which took place, also to mimic or imitate people's actions. She is represented in the plate ludicrously imitating one of the officers who used to walk up and down near the ship's side for exercise, of which she could not see the utility. The staff in her hand is one of the spears with which seals are killed. She appeared about fifty-five years of age, and being rather bent was only about four feet seven inches in stature. She was supported by her children, and she was daily employed gleaning at the place where sweepings had been previously deposited on the ice at a little distance from the ship. Her face was much weather-beaten, and had in it the delineation of care and anxiety. She was never detected in dishonest practices.

Manellia and her husband returned to North Hendon in the following or second summer, where there infant died, soon after which they departed and took up their station at Padliak, where we found them living on *erkalook*, a small sea fish, which has been already described.

POYETTAK, KAKIKAGIU, AND AKNALUA.

KAKIKAGIU is represented standing between her two husbands. She was a native of Akullee, and by far the most robust woman we met with; her stature was five feet three inches and a quarter; her face was broad, her eyes, nose, and mouth small, as also her hands and feet, in proportion to her figure which was completely *en bon point*; her favourite husband was Aknalua, who was decidedly better looking than Poyettak, accordingly the latter was sent out to hunt and procure food whilst the other remained at home, and it was rather surprising to see how cheerfully he would obey from time to time this, which appeared to us, unfair command, of a capricious or partial wife, and bring home the fruits of his labours to be equally divided! On one of these occasions, Poyettak was sent to guide Commander Ross to the Umingmak (musk ox) mountains, and was absent a whole week. It was this woman who had obtained some knowledge of the ships under Sir Edward Parry, and by whose advice the party advanced to communicate with us; when Poweytag had lost his adopted child, the fury of the old man was appeased by her interference, and she was one of the most useful and intelligent in giving us information about the coast, rivers, stations, &c. Latterly she was not very honest, and Aknalua made her return a carpenter's rule which she had taken and concealed. She was about twenty-five years of age.

Poyettak was about twenty-eight years of age, he measured five feet four inches and five-eighths; his complexion was darker than that of Aknalua, and his features not so pleasing, though small in proportion; he was however a successful hunter, and very active.

Aknalua was about twenty-six years of age, measured five feet eight inches, was strong and well made; his complexion was not so dark as many of them, and his features were very pleasing; he seemed to have a very good temper, and often came to the ship, but never was accused of taking any thing away. Being his wife's favourite, he generally came to the ship with her, and was neither covetous nor dishonest.

We did not see this family after the first year.

K E M I G.

THIS young woman, who was the most corpulent of the whole tribe, is represented as sitting on the bed within a snow hut, to have the tatooing delineated; this consisted of three lines horizontally across each cheek, and three vertically across the chin, a double line round the neck and breast above the shoulder, another below the shoulder, and a third above the elbow; between each of these lines, which encircled the arms and parallel to each other, there were ornamental devices, but without any meaning; and all the women were tatooed exactly in the same way. She was five feet four inches and a quarter high, and was about twenty-five years of age. Her husband's name was Konag, who was also young, but they had no children, which is considered a great reproach to both parties. They went to the western sea in the summer of 1830, but returned in 1831 to us at Sheriff's harbour, at which time she had become much more corpulent, and was still without a family. Her skin was a dirty copper colour, her face was broad, her brow very low, her eyes, nose, and mouth small, and her cheeks very red. She seemed very indolent, as well as her husband; and, at one time, they were so unsuccessful that we had to relieve their wants to keep them from starving. Her mother, whose name was Nimna Himna, but nicknamed by the sailors, Old Greedy, as well as herself, was a constant visitor to the ship,

and generally carried off something which she had picked up. On one occasion, when coming up the ladder, she was tumbled off by the surgeon, and falling on her back, pretended to faint; from which, although all the doctor could do could not recover her, she was restored by the offer of an empty tin case, which had contained preserved meat: a stratagem which she subsequently tried more than once without success. She was about sixty years of age, five feet two inches high, extremely ill-looking, and decidedly the most disgusting of the whole tribe.

KANAYOKE.

KANAYOKE came to the ship at Felix harbour, in the spring of 1830; he had wintered at Padliak, and, having crossed the isthmus, joined a party about six miles to the northward, one of whom guided him to us. It appeared that he was the father of Poyetta, by Kanguagiu, Alictu's widow, now the wife of his brother, Poweytag. He was about sixty-five years of age, was five feet eight inches high, and remarkable for being darker in colour than any of the rest. It appears that he lived to the westward, and had communication with a tribe in that direction where the females were most numerous; and when a wife was wanted for some of his own party, he transferred to him his own wife, and went for another to himself, a friendly service which we understood he had performed no less than five times; and he had now brought his sixth spouse, by whom he had three young children, to visit three of his former wives, and we witnessed the whole party living together in perfect harmony! The advantages of this, as far as he was concerned, were obvious; for in each of the five different families he had a son or two, so that in his old age he might, according to custom, claim support from all or any of them, or from the most successful in hunting, as he was entitled to the share of a father. He brought several good specimens of natural history, for which he was well rewarded, and he gave us some valuable information

respecting the western sea and the nature of the country to the westward. He also informed us, that Kablala, who had a club-foot, and her husband, were to be at Padliak, and that we should see them next year. On the second visit, he brought his present wife and children to see us, whose description will occupy the next page.

**OOBLOORIA, PANINGAVOKE, AMINGO, AND
NULLINGIAK.**

AMINGO, the sixth wife of Kanayoke, is represented sitting at the table in the cabin of the Victory, between her two children, and an infant on her shoulder whose name was *Aknallua*. She was extremely well clothed in deer-skins, and so were her children, of whom the parents were very fond. Her complexion was much lighter and paler than the other females, and her behaviour very modest and unassuming. She sat at the table, and viewed the pictures that were set before her with great delight, pointing out to her children every thing she thought wonderful, as soon as it had been explained to herself. Her children were also very pretty, the eldest about four years old, the next two and a half, and the youngest about six months. After remaining some time, she returned to the huts, about six miles off, and we had not an opportunity of seeing her again. We understood that the whole family had gone off, with that of *Kablala*, to the westward.

Ooblooria, who is represented standing with a whip in one hand and a coil of line in the other, came with them. He was the eldest son of *Ikmallik* and *Apelagliu*, about seventeen years of age; his stature was five feet two inches and three-quarters, stout made; his dress, on this occasion, was rather ornamental as well as useful, having above his deer-skin jacket, a tippet made of the belly part

of the deer-skin, which being white, had a very pretty, as well as comfortable appearance; he was one of the guides which Commander Ross had on his first journey to Neitchillee and Padliak, on which occasion his provisions ran short, and his gratitude, as well as that of his parents, has been dwelt upon already in the Narrative. He was a fine active and intelligent lad, and was, consequently, a great favourite with us. He was married to Shullanina, Tulluahiu's daughter, and his own cousin, his mother, Apellagiu, being Tulluahiu's sister. We had no reason to doubt that he was strictly honest, as also the whole family, who were certainly, and very deservedly, the favourites; and as they showed no disposition even to covet, they were always presented with more of what was useful to them than the rest.

NEWEETIOKE AND KONYAROKLIK.

NEWEETIOKE was brother to Ikmalik, and certainly the tallest of the Boothians, being five feet ten inches high, but he had been described to us much taller before he came to us the second year at Sheriff's harbour; but when he stood up beside Mr. Abernethy, who was six feet two inches, he looked so much shorter that his brother was quite astonished. He is dressed in a bear-skin jacket with deer-skin sleeves, and his trousers were bear-skin. He had, of course, been told all about us before he came, and his brother having received a great many things, he was led to expect the same; he had, however, very little to give in exchange, and consequently was disappointed, and when nothing else would do he fell on an ingenious stratagem to obtain a piece of wood which he had fixed his mind upon. Having consulted his companions, it was agreed that they were to show us their method of killing seals, accordingly one personated a seal lying on the ice, now and then pretending to sleep, and sometimes holding up his head as if to look around; while the others, watching his motions, gradually approach by creeping on their bellies, with a spear. Neweetioke, while this farce was going on, and supposing that our attention was entirely engrossed with it, slipped away, and having got the piece of wood, placed it along his spear, and on each end put over a boot, as if to carry them for the purpose of drying them by

suspending them across his shoulders; but, he did not escape the vigilance of our look-out men, who caught him in the act, which was fatal to his obtaining any thing he wanted, and had he not been Ikmallik's brother, he would have been sent off in disgrace. He had a wife and two children, the eldest of which was one of the performers in the stratagem. The detection, however, caused a hearty laugh. Although his forehead was low, his features were larger than most of them, and he appeared to be about forty-five years of age.

Konyaroklik (or Bald-head) came at the same time with Neweetioke, and had one son, called Ulla, of whom he was very proud; he was still more so of his *bald head*, which was unique here, being the only instance we saw of it. He was five feet six inches high, about fifty years of age, and rather good-looking. He brought us some skins, for which he was liberally paid, and was delighted when he saw his portrait, which I made of him. His costume was a dark deer-skin jacket and bear-skin trousers.

UDLIA, AWTIGIN, AND PALURAK.

AWTIGIN is represented in the engraving standing between his two wives. This family came to us at Sheriff's harbour in the spring of 1831, having learnt of our position from our former friends. His jacket is of reindeer-skin, as also those of his wives; his trousers are of bear-skin, and his wives' seal-skin, as also their boots. They had several good skins to dispose of, and left us well pleased with what they had in exchange. It appeared that he had first taken Udlia for a wife, and, in consequence of her having no child, he took Palurak in addition, by whom he has a son; notwithstanding this, the two wives appeared on perfect good terms with each other, and were equally beloved (if I may so call it) by their husband. Awtigin was five feet six inches high, stout made, but had rather a stupid look. He was very desirous to possess many things which he saw, but was not detected in pilfering.

Udlia was five feet one inch and a half high, and rather delicately made; she could not be above twenty-five years of age, while her copartner was two inches shorter, and about two years younger. The child's name was Karuktachiü, and was about two years old. These females were delighted with the presents which we gave them, and showed no disposition to covet or to steal. After remaining with us about a week they departed to fish on one of the lakes.

Like the rest, they promised to return, but our departure would disappoint them, as we left Sheriff's harbour in the August following.

SHULLANINA, TULLUAHIU, AND TIRIKSHIU.

TULLUAHIU, his wife Tirikshiu, and his daughter Shullanina, being the most remarkable family we met with; a plate of them has been given in the book, and their names are so often introduced that little of their history remains to be told. The former, whose name signifies a young raven, was about forty years of age, he measured five feet eight inches, and was rather more corpulent than the rest, probably from being unable to take exercise; his features and costume are well represented, as also those of his wife and daughter. When we approached them on the first day of communication, Tulluahiu was stationed in the middle of the column, standing on one leg, and supported between Ikmallik and another, and was armed with a long knife, which he kept behind his back until peace was established. He was one of the first we had on board, and was remarkable for imitating every thing he saw done. It has been already mentioned that the wooden leg which we gave him was the means of establishing friendship between us, and he was always grateful for that signal service which we rendered to him. He was never detected stealing, but his wife was not so honest, and when she did succeed in carrying any thing away, her husband always made her bring it back. In the plate she is represented concealing a piece of wood, in which she was detected. She was sister to Ikmallik, and being five feet five inches and

a quarter high, was one of the tallest of the women; her name signified an ermine, and she was about thirty-eight years of age. Shullanina, her daughter, was the eldest of three children; she was decidedly the prettiest girl and had the best figure; her cheeks were rosy, and, when washed with soap and water, she looked very well, and appeared to have every amiable quality. The proof she gave of her obedience, by consenting to be exchanged for a wooden leg, has already been dwelt upon in the Narrative, as well as her subsequent marriage with her cousin Ooblooria, Ikmallik's son. After which I met with the whole family at Lindsay river. At Sheriff's harbour, a very short time after, they paid us a visit. Tulluahiu had damaged the trunk part of his wooden leg; this was repaired by bands of copper, and several spare legs given to him before we parted for the last time, and which excited new demonstrations of their gratitude and regard.

IKMALLIK AND APELLAGLIU.

IKMALLIK, and his wife Apellagliu, were certainly the best of the whole of the natives, and they seemed most respected by the rest. They are represented in the Narrative as drawing a map of the country; and, from the information which he likewise gave us, he obtained the name of the "Hydrographer," and we always found what he, or his son Ooblooria, told us to be correct. They brought us every thing they could procure, leaving it entirely to us what they were to have in exchange, and were always contented with whatever was given to them; by this kind of conduct they gained our confidence and esteem, and in the end they got best rewarded. They were extremely attached to their children, and for any kindness shown to them their gratitude knew no bounds. The mutual desire to oblige each other, and every one else, was at once manifest and delightful. Ikmallik was the first who remained a whole night and slept on board, having been employed by me in building my magnetic observatory of snow, which he did cheerfully and extremely well. His youngest child, about two years old, was called Camuka, and was very pretty; she was clothed in skins so as to resemble a ball, and was often entertained with prints in the cabin. Besides their own three children, two of which were at the breast, they had supported two nephews who had lost their parents; one of which, Awack, had now grown up, and was the companion

and friend of Ooblooria; he was one of the most active and expert hunters, as well as the most successful of the whole, and was one of Commander Ross's guides on the first journey. I met with him afterwards in Thoms bay, and he was the means of our discovering the great Salmon (Lord Lindsay) river.

Apellagliu was five feet three inches and a half high, rather corpulent, and by no means good looking; she was sister to Tulluahiu, in whose features there was a family resemblance, and was about thirty-six years of age. Awack was about twenty-two, had a very pleasing countenance, and was five feet eight inches high.

Ikmallik had another brother, besides Neweetioke, who was named Atayaraktak, who was an active young man, about thirty, and five feet eight inches and a half high; his wife was a very delicate person, and they had two children. It was this man and Ookurahiu who first conducted me to Neitchillee, while Commander Ross was on a journey to the westward. Ookurachiu was also a nephew to Ikmallik, but lived with his mother Alurak.

AJOUA, AUOWAHRIU, AND NAQUASSIAK.

AJOUA was an old woman, the mother of Tulluahiu and Auowahriu, who was very much bent, and could not walk without the aid of a staff; she was very covetous, and asked for almost every thing she saw; at length I proposed that she should carry off the ship on her back, which had the appearance of being bent for receiving a burden, at which her sons were much amused; we received, however, from her a curious piece of wood which had been given to her by Cablala, and would have been a passport if we had succeeded in getting to the westward. This curiosity I have still in my possession: of course she was well rewarded for it; but she always put us in mind that her parting with it was a great favour. Auowahriu was her second son, and was also a cripple from accident; he had been a very powerful man and an excellent hunter, and was remarkable for the nice order in which he kept his spears, bows, and arrows. He was very dexterous at killing salmon, and in the management of a canoe; we met with him for the last time at the salmon fishery, at the mouth of Lindsay river. He had three children who had lost their mother. Naquassiak, the eldest, was about sixteen years of age, very tall and thin, but not very active; when he went to show Commander Ross the way to Shagavoke, he was detected in telling a falsehood, and thereby obtained the nickname of *Shaglo*, which signifies a

lie; but he never was offended at this appellation, which indeed was a source of merriment whenever it was mentioned. The other two children were infants; but when Tiagashu died, his widow Alurak became the wife of Auowahriu, and took charge of the children. This family were not covetous nor inclined to pilfer, and were therefore always in favour.

NOYENNAK AND IBLUSHE, TIKATAGIU.

THESE young men were brothers of Tiagashu, Poyettak, and Aknallua, by the same mother, but by a different father. Noyennak was about twenty-five years of age, five feet four inches and three-eighths high; his complexion was lighter and more sallow than his brothers, and he seemed very quiet and inoffensive; he contributed to the support of his aged mother, and when his father Alictu died he was much grieved. Iblushe, his brother, was about thirty years of age, five feet five inches and three-quarters high, and also of a light sallow complexion. He was remarkable for wearing ornaments of foxes' teeth hung round his forehead, and at each temple a bear's tooth; his countenance bespoke extreme good-nature, which we found completely verified. We understood that this family suffered considerably for want of food after they left us, and we did not meet them again on the second year.

Tikatagiu was one of those who did not come to us until late in the first season. He was a very fine young man, about twenty-six years of age, and measured five feet nine inches. His wife, whose name was Kuria, was a very shy delicate woman, and had one infant named Karuktachiu. He was an excellent hunter, and had a very superior dog, of which he was very fond, and could not be bribed to part with him. He came and built a snow hut very near to the ship, and remained until he had exchanged

skins and other articles which he could spare, for wood and iron. I met him some time afterwards at Neitchillee, and obtained a supply of fish, which were then in great plenty.

MILLUCTU, TOPAKA, AWACK (1), AND ALLINACHRIU.

MILLUCTU was one of those who was very much at the ship, and was rather inclined to possess himself of what he saw, and was particularly jealous of any one receiving more than himself; when he perceived the quantity of wood which composed Tulluahiu's wooden leg, he complained that he could not walk on his right leg, and begged that he also might have a wooden one: when he was told that of course his leg, like that of Tulluahiu, must be taken off, he said he had not time, or that it was not convenient now, and promised he would come to-morrow; but when he came he said that *his leg was better*. On another occasion when Ikmalik was rewarded with a tin meat-case, for dancing like a bear, in a ring formed by the women, he began also to exhibit; but his performance was so much inferior to his predecessor, that he only excited laughter; but seeing that he was very much disappointed, I gave him a tin case also, which turned the laugh on his side. He was about twenty-five years of age, five feet four inches high, and well made. He had a wife and two children; and his mother, an old woman named Topaka lived with him. This old lady was the first who committed a theft, by stealing a pair of brass snuffers, which was, however, found out by the rest, and immediately returned. She was one of those who gleaned daily on the dunghill. Awack (1) was a man about forty-five years of age, five feet three

inches and three quarters high ; he was very quiet and industrious, and exchanged a great many articles with us honestly. His wife's name was Allenachriu, about his own age, they had a boy named Illiklaptuain and a girl called Beaktakhilla, the former six and the latter seven and a half years old. We met them afterwards in Padliak, in possession of plenty of fish, with which they supplied us ; and the lady politely convoyed us several miles on our way home. We did not see them during the last two years.

As the rest of the natives have nothing remarkable or peculiar to them, I shall only mention a few of their names, &c.

Aunai, an old woman, sixty years of age, five feet three inches and a quarter high.—Auatiu, an old woman, sixty-four years of age, four feet ten inches and seven-eighths high.—Strowok, an old woman, fifty-five years of age, five feet two inches and a half high.—Ugluta, an old woman, fifty years of age, five feet high.—Sheppung, a child, five years of age.—Karaksachiu, a child, six years of age.—Nangiak, a woman, forty years of age, four feet nine inches and a half high.

The above will be sufficient to show that the Boothians are generally below the middle size. The first party we met with consisted of ninety-nine souls, viz., thirty-three men, twenty-five of whom had wives ; twelve old men and women, and twenty-nine children. We afterwards met with about sixty more, so that the country is but thinly peopled, the whole population amounting to no more than a hundred and sixty souls. Upon the whole, in the unqualified state of nature in which they were found, they were the happiest of human beings, on whom Providence has kindly and bountifully bestowed every necessary gift, if not every blessing.

VOCABULARY

OF THE

ENGLISH, DANISH, AND ESQUIMAUX
LANGUAGES.

P R E F A C E.

IN compiling the following vocabulary and dialogues I have adhered to the method of spelling the words which was published by Fabricius, both in the shape of a Grammar and a Dictionary; the last edition of which was printed at Copenhagen in 1804, and to which I refer my readers for any further explanation than I have thought necessary to give.

The pronunciation of the vowels, both in the Danish and Esquimaux language is as follows :

A	sounds	as	A	in	War.
E	.	.	E	.	Cellar.
I	.	.	I	.	Line.
O	.	.	O	.	Block.
U	.	.	U	.	Full.
Oa	.	.	O	.	Load.
Ou	.	.	Oo	.	Rood.
Ej	.	.	Y	.	Fly.
Aj	.	.	I	.	I.

The consonants are the same as in the English language, with the following exceptions :

G sounds as G in Gay.

J Y . . Yesterday.

L and R, in the Esquimaux language, never begin a word, excepting in *lu* (and), which, however, is often a definite termination. Neither does H begin any but a proper name.

In the whole narrative I have adhered to the above pronunciation, which to me was perfectly easy, from being acquainted with the Swedish and Danish languages, and which is, indeed, the best method as being the least complicated ; but it will be observed that Commander Ross has not followed this plan, and therefore in reading his narrative this must not be attended to.

N.B.—This Vocabulary is extended, that it may be found useful to those who navigate Davis's straits and Baffin's bay, as well as to future Voyages of Discovery.

The Missionaries of the Established Church reside at Julianashaab, Godthaab, Holstenborg, Egedesminde, Umanak, and Upernivik; their districts are noted with letters as their residence.

The difference between married men and married women arises from some of the latter being married to Danes.

Note.—The MORAVIAN MISSIONS at Julianashaab district, 424 men, and 536 women.

at Fiskensæset ditto 153 do. and 214 do.

at Godthaab ditto 156 do. and 214 do.

Total..... 733 men 964 women. Total of both sexes, 1697, which have not been included in the previous register.

CHRONOMETERS.

EVER since the year 1794, my attention has been much devoted to the practical use of chronometers, both while I belonged to the Honourable East India Company's service, and in the Royal Navy, where I had, when serving under the gallant Lord de Saumarez, the charge of the navigation of both the Channel and the Baltic fleet.

On taking command of the expedition fitted out for the discovery of a North-west Passage, my first care was to obtain good chronometers, and also as many of them as possible. My own chronometer was made by the late justly celebrated Earnshaw, and was certainly a very superior one; I therefore took it as the standard for comparison, with the whole thirteen. Several of these were the property of private persons, who either lent them to the expedition, or sent them on trial: of the latter description were those sent by Messrs. Parkinson and Frodsham, who sent two with a memorandum that their rate would increase to fourteen seconds and then remain steady: a circumstance which actually took place, and which went to prove that they had discovered some new principle, in their regulation or construction, and my report on them could not be but very favourable. Since this every expedition has been furnished by Parkinson and Frodsham with these valuable machines, and the reports on their performance have been uniformly favourable. On this voyage I purchased of them the pocket chronometer 1081, which was distinguished as being that made for Sir E. Parry, on his attempt to reach the North Pole, as well as for its uniform rate. These makers also kindly sent with me a box chronometer at their own risk, which could not but be a great acquisition. Both of these performed to admiration; the box chronometer, until we left Victoria harbour, where it was purposely allowed to run down that it might be more easily carried, and the pocket one during the whole time. On our arrival they were both returned to the makers, and being desirous to make public the principle on which these instruments

have been brought to such perfection, and reserving my own observations on it for the conclusion of this article, I shall give their answer to my request in their own words.

4, *Change Alley*, May 15, 1834.

SIR,

IN compliance with your desire to be furnished with a report of the condition of the two chronometers of our make, which you took with you in your late Expedition to the Arctic Regions, we have examined them with the most careful and minute attention, and find them in an excellent state: indeed, very far more perfect than could have been expected after such a length of time, and the severe trials which they must have undergone.

With regard to their peculiar construction, which you at the same time requested us to describe, as you were desirous of publishing it for the benefit of science and navigation generally, we have no hesitation in complying with your wishes; so far as is consistent with justice to ourselves, and we hope that our communication may prove useful.

The *peculiar principle* which we have discovered is of the highest importance in giving the final adjustment to chronometers, as by it we are enabled, *in all cases*, to give permanence to their rates, within the limits of exactness requisite in navigation.

We beg, in the first place, to disclaim all intention of insinuating that in the mechanical construction of our instruments there is any thing superior to, or materially different from, those made by other respectable makers; for we are well aware, that all chronometers lately made by intelligent artists, are on the same mechanical principle. But the fact is notorious, that of several instruments made with equal care, reference being had only to their mechanical construction, some are found to perform well, and others indifferently; while nothing can be discovered in the workmanship which will in any way account for the variation.

Chronometers in general, as at present constructed, are found progressively to accelerate on their rates, and in many instances this takes place to such an extent, that a new rate is required, rendering them ill suited for long voyages; on the contrary, others have a continual disposition to lose on their rates, and are therefore equally unsuited to the wants of the seaman.

But whether the rates of chronometers were accelerated or retarded in use, there existed no *recognised* or *known* remedy for the evil, UNTIL WE MADE THE DISCOVERY, which it is one object of this communication to record ^{our} claim to. Some artists have trusted to *time* for its correction; and a writer in a scientific journal* has recently

* *Nautical Magazine*.

even assigned the period when the cure might be expected to be completed: but *time* being no party to the bargain, generally left the instruments thus turned over to its benevolence to pursue their vagaries without interference.

The cause, which the writer alluded to has assigned for this acceleration, is the use of tempered balance-springs; now tempered balance-springs have been in use for more than half a century, and forty years ago they were made by ourselves. If time, therefore, could have cured the defects of the tempered balance-spring, as stated in the paper above alluded to, these old chronometers would now have been excellent instruments, which certainly they are not in general found to be.

The consequence has been, that the rates of most of the chronometers at this moment in existence, can only be considered constant for short intervals of time. Many years have elapsed since our attention was drawn to this peculiarity, from several mortifying circumstances which occurred in our own experience; and after satisfying ourselves that it was in vain to look for the cause of so perplexing a phenomenon in the *mechanical construction* of the instrument, we resolved to examine the *physical condition* of the materials of which the balance and its spring are made: and we discovered that the greater part, if not the whole of the discrepances, were owing to circumstances in this *physical condition*.

After many experiments and much investigation, we had the good fortune to discover the means of correcting this physical peculiarity, either completely, or so nearly, that we can now undertake (after ascertaining the tendency) so to alter the physical properties of the balance and its spring, as to make *ANY* chronometer, whose mechanical construction is otherwise satisfactory, perform with sufficient exactness for every purpose for which chronometers are generally required.

The acceleration of chronometers on their rates, hitherto unexplained in the history of chronometers, is produced by, the constant action of winding and unwinding the balance-spring, which, in chronometers beating half seconds, takes place two hundred and forty times in each minute, and it is thereby deprived of a portion of its elasticity. It becomes consequently stiffer, stronger, and more stubborn; and as the motions of the balance (the measurer of time) are regulated by this spring, the vibrations become more rapid, and are performed in less time.

The cause of chronometers losing on their rates, is also generally to be traced to the physical imperfection of the balance-and-spring; which, contrary to what takes place in the tempered spring, becomes relaxed by constant action, combined with other causes; and consequently has less power over the vibrations of the balance. But independently of all accidental circumstances, the chronometer is continually changing its rate, with every alteration of tension in the balance-spring.

The scientific artist may, indeed, give to this spring the isochronal property, so far that under given and constant circumstances, unequal arcs of vibration in the balance, will be performed in equal time; but this adjustment will in no degree counteract the effect occasioned by change of tension to which we have been adverting.

We do not allude in the preceding remarks to defective compensation for change of temperature, but to that gradual deviation from the rate which many chronometers are found to exhibit, and to an extent that often interferes with their usefulness.

It is true that all chronometer makers do occasionally produce instruments, which, for a sufficient length of time, keep steady rates; but they do so only from accidental circumstances, of which the makers themselves are not always aware. They approximate to the correction which we have discovered the means of making *in all cases*.

In our researches on this subject, we have found that the defect in the correction for change of temperature, is amongst the least of the difficulties to be contended with; and the value of the principle of adjustment which we have discovered has been eminently proved by the accurate performance of our chronometers, which have been exposed to the severities of the arctic winters, in all the Polar voyages. In one of those voyages, *eleven* out of *fifteen* chronometers stopped from the cold; whilst four made by us, (all of ours that were sent) maintained the same rates at Melville island that they were found to have in London after the return of the expedition.

The chronometrical parts of our chronometers consisting of the compensation balance and the detached escapement, are the same as invented before 1766, by the eminently distinguished artist, M. Le Roy, of Paris, with the important improvement of the detant on a spring instead of on pivots, as made by the late Mr. Earnshaw; together with some minor but useful alterations in the execution and arrangement suggested by our own experience.

We have said before, that chronometers made by the same artist do not always perform equally well, although the same workmen are employed, the same labour is bestowed, and the same attention paid to each. Several modern artists have endeavoured to remedy this defect by means of mechanical contrivances, some of which display considerable ingenuity and are apparently very plausible; but, however beautiful in theory, these contrivances have produced no practical advantage; no one has yet discovered the seat of the disease, or the cause of so remarkable an effect. We reassert that *no mechanical contrivance* can remedy the defect: it is only to be remedied by a knowledge of the principle which we have discovered.

Le Roy's original inventions of the balance for compensating for changes of temperature, and the escapement, were entitled, from their beautiful simplicity, to the reward so justly bestowed upon him; and with the improvement above alluded

to, by our countryman Earnshaw, continue unrivalled: in fact they are generally adopted by all intelligent chronometer-makers.

We consider that the best balance is that composed of laminæ of brass and steel, when properly proportioned, and worked so that the particles are placed under no particular or partial constraint, which might prevent their free and natural action throughout the whole periphery of the balance. This we consider an important requisite; for to the want of affinity in the condition of the particles, we attribute some of the irregularities observed in the rates of chronometers, when subject to the rigorous test of daily comparison—more particularly after sudden changes of temperature. There are inherent defects in the shape of the balance, which prevent its affording theoretically the means of a perfect compensation; but it is doubtful whether other forms, which appear preferable in theory, would be found in practice to answer so well.

As evidence of our possessing means peculiar to ourselves, of bringing a chronometer to keep a steady rate, we may mention the fact, amongst numerous other instances, and we do it with much satisfaction, that of the *eight* chronometers entitled to the prizes for the most accurate performance during the last three annual public trials at the Royal Observatory, at Greenwich, *five* were constructed by us, and adjusted on the *principle peculiar to ourselves*.

We may add, that within the last fifteen years, during which period we have been adjusting our chronometers on THIS PRINCIPLE, we have had extensive experience of its efficacy, having made and sold more than twice as many marine chronometers as any other maker has done during thirty years;—the best proof that the public have appreciated our discovery.

Attempts have recently been made to introduce *glass* in the construction of the balance-spring; and the first performance of some of the instruments in which this alteration was introduced, was very satisfactory.

There is, however, reason to apprehend that this *material* will not be found to give to the instrument a *permanent* rate, as one of the very best of them has, in the course of a few months, deviated from its rate to the amount of seven seconds a day: while another chronometer, under the same circumstances, on the usual construction, with a steel balance-spring, and which at the last public trial (1833) was second in performance to one made by us, kept a remarkably steady rate.

We may also be allowed to state, that on this trial (1833), sixty chronometers were sent by various makers; and at the termination, the numbers were reduced to ten, *four* of which were made by us; and the extreme variation of each, in the twelve months, was considerably within the limits fixed in 1828 for the reward of Three Hundred Pounds. Three of them made less error than our chronometer, No. 1410, in 1828;

for which we then received the premium of Three Hundred Pounds. The extreme variation of these five chronometers was as follows :

In 1828, No. 1410 in twelve months $1.41''$ actual extreme variation.

1833	{	679	ditto	0.98
		1600	ditto	1.31
		460	ditto	1.24
		1502	ditto	1.52

In 1830, one of our chronometers was entitled to the second prize, and some others of our making were within the limits.

In the trial of 1831, the chronometers made by us obtained the *whole of the three prizes*, and another was fifth on the trial list. We may be excused for making particular reference to the trials of this year, from the remarkable circumstance, that in all the preceding years, from 1822, when the trials for prizes were first established, a period in which several hundreds of chronometers had been sent for trial, but four had performed within one second of extreme variation in the twelve months; whilst in this trial the *WHOLE* of our four chronometers went within less than a second of extreme variation; the following being the extreme variations as published by the Astronomer Royal :

No. 311 in twelve months $0.70''$ actual extreme variation.

2	ditto	0.86
665	ditto	0.89
1	ditto	0.99

In 1832 and 1833, chronometers made by us were entitled to prizes; and several others of our manufacture have been frequently within the limits prescribed by the Government, forming a large proportion of the best chronometers submitted to *public trial*.

It has been repeatedly suggested to us, that a PRINCIPLE so important as ours has proved to be, should be imparted to the public, as every thing tending to the improvement of chronometers is a matter of national concernment. We are willing to give up to the public the benefit of our knowledge and experience in these matters, on receiving, as others have done, an adequate compensation for the value which the discovery is of to us in our private business; but we hold ourselves justified in withholding an explanation of the principle, until it either ceases to be of importance to us, or we are adequately remunerated for disclosing it.

Government having directed that the public trials of chronometers at Greenwich, for

prizes, shall cease after the present year, a few remarks on the origin of those trials, and on the favourable effect which they have had on the art of chronometer making, may not inappropriately close our observations.

Notwithstanding the encouragement which Government had long afforded to the art, by purchasing chronometers largely, and at liberal prices, for the use of the navy; and the very considerable rewards which had been given to three of the leading artists (3000*l.* each) for the superior performance of some instruments made by them, yet the general state of the art was much below what was generally believed, and might have been expected.

Aware of this fact, and desirous that the art which we exercised should participate in the general improvement, we, in 1818, addressed a letter to J. W. Croker, Esq., at that time Secretary to the Admiralty, respectfully suggesting that Government might further and most essentially aid the progress of the art, by giving *frequent and small rewards to ingenious workmen who made instruments that actually performed well, without reference to the principles on which they were constructed.*

The public trials at the Royal Observatory commenced in 1820, and the performance of the chronometers on the first trial proved the correctness of the opinion which we had formed as to the general state of the art of chronometer making. The prizes of 300*l.* and 200*l.* were that year adjudged to chronometers which Government would not at the present time purchase at any price.

Several of the chronometers which we sent on trial in the various scientific expeditions to the Polar Seas and towards the Equator, having performed satisfactorily, we sent some of our experimental chronometers to Greenwich on trial, a few years after the public trials were first established; and the opportunity thus afforded us of having the effect of our successive alterations tested by daily observation, enabled us to detect many minute sources of error, which we should otherwise most probably never have discovered.

The opportunity, too, of returning for trial chronometers which, having performed unsatisfactorily we had endeavoured to improve, gradually led us to the discovery of the principle which enables us now to control at pleasure, and to counteract, any general tendency in chronometers to deviate from their rates.

We are, Sir,

Yours, respectfully,

• PARKINSON & FRODSHAM.

To Capt. Sir John Ross, R.N.,

&c. &c. &c.

Those who have perused the above statement from Messrs. Parkinson and Frodsham, and are at all interested in the improvement of navigation, cannot but be desirous that a fair trial should be given to this important discovery ; and if it is found that chronometers which are the production of respectable artisans, and which from causes hitherto unknown deviate from their rates, so as to be comparatively useless, can be corrected by the application of their principle, so as to become sufficiently perfect for the purposes of navigation, by maintaining the uniform rate within the limits prescribed by Government, no one will deny, that this important discovery should be made public, and that such discovery is fully entitled to a liberal compensation ; and I cannot conclude this article without recommending it to the serious attention of those whose duty it is to inquire into and reward merit.

Mr. Murray, a very respectable chronometer-maker of London, being desirous to establish the excellent going of his chronometers, sent No. 620 eight day, 634 two day, and 558 one day, all box chronometers, which could not be a great acquisition to us ; and it is but justice to say that they were excellent instruments, for although they all gained at first, they obtained a constant rate, from which they did not deviate whilst in my possession. I regret much that it was not in my power to bring them home, as I have no doubt they would have been found perfect, with the exception of one which met with an accident.

In addition to No. 571, box chronometer, and of 1081 for the pocket, of Parkinson and Frodsham I purchased No. 418, pocket chronometer, of Barraud, which I knew to be good, having it formerly in my possession ; but the main spring gave way soon after we sailed, which reduced my number to five. These were under the charge of Commander Ross, until July, 1831, after which they were all under my own care, and the only two that were brought home were those by Parkinson and Frodsham.

AURORA BOREALIS.

NEW THEORY.

MANY theories have been proposed during the last century, to account for the nature and appearance of this beautiful phenomenon, but to each of these, and to all, objections have been made, that I think cannot be justly applied to the following, which has been founded on a long series of observations made carefully by myself on this interesting subject, and under circumstances peculiarly advantageous.

Before I proceeded on my voyage of 1818, my attention was directed to the phenomenon of the Aurora by the late Dr. Wollaston, who had collected, with great pains, much information on the subject, which he kindly transmitted to me, as well as his own observations, from which, however, he came to no other conclusion than a supposition that “the Aurora was beyond the atmosphere of the earth.”

As the expedition which I commanded in 1818 did not winter in the Arctic Regions, my observations during that voyage were confined to the months of September and October, during which time the ships were moving in a southerly direction from the

latitude of 74° to 58° north, when it was observed that from the latitude of 74° until 66° , the phenomenon was seen to the *southward*, particularly at midnight; but when the ship had passed to the southward of the latitude of 66° , it was seen to the *northward*. In several instances the Aurora was distinctly observed to be between the two ships, and also between the ships and the icebergs; proving unquestionably that it could not be at that time beyond the atmosphere of the earth. This indeed was the only fact which I completely established during that voyage, but which was a conclusion that led me to inquire how its proximity to the earth was to be accounted for. Both at my observatory in Scotland, and during my late and long-protracted residence in the Arctic Regions, my attention has been particularly directed to this interesting subject, and my conclusions are, that *the splendid phenomenon, called the Aurora, is entirely occasioned by the action of the sun's rays upon the vast body of icy and of snowy plains and mountains which surround the poles.*

The rays of the sun, *in the first instance*, are reflected, from uneven, plain, or variegated surfaces, of the coloured, icy, or snow-clad substances, which are presented to them at the point of incidence by the rotation of the earth, and passing over the poles reach and illuminate clouds which are only rendered visible to us by such illumination, these clouds having positive, negative, and reflecting qualities, possess the power of producing all the surprising effects which have been observed by distributing the rays they have received, and as they receive them, in every direction, and according to the state of the atmosphere, give additional

variety to the original colours as reflected from the point of incidence; and further, if due regard is paid to the properties of light, its connexion both with magnetism and electricity may be satisfactorily explained.

IN SUPPORT OF THIS THEORY—In the first place, we have the fact, that when the spectator's position on the earth is to the northward of the 69° of north latitude, the Aurora is generally observed to bear to the southward, very seldom to the northward of east or west, and never in that direction or in the north, unless the sun is in opposition, or a region of icy or snowy substance is between the spectator and the bearings of the sun; although the illuminated clouds which I have mentioned might there, as in a lower latitude, very possibly reflect the rays they have received in every horizontal, as well as vertical direction.

Secondly. The atmosphere between the sun and the spectator is always clear, whether he is to the southward or northward of the Aurora. When he is looking at the Aurora from a high latitude, towards it in the south, the sun is then at his back to the north; and if the sky becomes cloudy in that (the northern) direction it is fatal, the Aurora immediately disappears, because the rays are intercepted by an impenetrable cloud. In like manner, when the spectator observes the Aurora bearing to the eastward or westward, if a cloud or fog intervenes between his position and the sun, it immediately disappears.

Thirdly. When the spectator sees the Aurora to the *northward*, he is always to the *southward* of the icy regions, and at that time the sky in the direction of the sun is always clear; should a cloud

intervene, either above or below the point of incidence, the phenomenon will disappear.

When the rays of the sun are reflected from a vast plain of icy substance to stationary and to us invisible clouds, it follows that the Aurora will remain a long time without changing, the rays being then reflected as from a circular or globular mirror, the angle of incidence and reflection remaining the same; but the moment that these rays arrive (by the earth's rotation) at water, or at some non-reflecting substance or surface, the Aurora suddenly disappears, as it does by an intervening cloud, which is a fact I have had confirmed by many observations.

With regard to the action of the Aurora on the magnetic needle, I need only say, that in common with every other kind of light, it has the property of affecting the needle or combining with magnetism. The effects of the Aurora on the needle were the same as the sudden approach of a naked candle, or when the light of a lamp was concentrated by a lens on the needle delicately suspended at a distance of eighty-four yards: an experiment which I repeatedly tried at Sheriff's harbour. With regard to electricity, it is notorious that there is less in the Arctic Regions than in any other place; and, during my first voyage, the electrometer was never moved by the electric fluid, although often tried.

The position of the Aurora Borealis in the heavens, depends much on the depression of the sun below the horizon of the spectator, on its bearings, and on the nature of the surface which first receives the sun's rays, at the point of incidence, which if uneven will produce the *capra saltans*, or merry dancers; if the surface is

even it will produce the *irabs*, or beam, provided the illuminated cloud is tranquil, but if not it will produce the *sagitta*, or *faces* (pencil rays, or torch); and if the rays are conveyed from thence by a second reflection, which is very often the case, the *bothinia*, or cave, will appear with the pencil rays ascending; the *corona* and *pithiæ* depend also on the shape of the clouds as well as their positive and negative qualities.

The colours of the Aurora depend on several circumstances: First, on the colours of the objects which originally receive the sun's rays at the incidental point. Secondly, on the state and qualities of the atmosphere, through which the reflected rays pass before they reach the clouds which they are to illuminate, and thereby render visible to the spectator not only the clouds themselves, but the various colours which the rays have then assumed. Thirdly, by the nature and composition of the cloud itself; however, it is most probable that the colour depends oftener or more materially on the colour of the objects which first receive the sun's rays at the incidental point, from whence they proceed by the laws of reflection, according to the various oblique directions of that surface; since the observations of Captain Cook, and other antarctic navigators, represent that the Aurora Australis has always "a clear white light," and that no coloured ice has been observed in the antarctic regions; while, on the contrary, ice of every colour has been observed by myself and others to exist in great abundance in the Arctic Regions.

The reason that the Aurora is not always visible, is evidently because the sky near the pole is often cloudy and foggy, particu-

larly in the spring and autumn, and when it is considered that the Aurora cannot be visible unless the atmosphere is clear on *both sides of the pole* in the direction of the sun, it will appear probable that it does not often happen; and in summer of course the Aurora cannot be seen in latitudes where the sun is then above the horizon below the pole, but I have often observed an appearance in the sky resembling the pencil rays of an aurora, with the exception that the illumination of the clouds was overpowered by the light of the day; and as the sun was then always in opposition to the northward, I can have no doubt but that this phenomenon was an aurora, caused by the rays of the sun reflected from the circumpolar mountains of ice to the clouds: and I may add, that this appearance has been noticed by several navigators of the Polar Regions.

The noise of the Aurora, described by some as resembling a silken flag exposed to a fresh breeze, and by others as that of a rushing noise like fireworks playing off, was never heard or observed, on any of the recent Arctic voyages, and it may be concluded that such a noise does not take place in these regions: if, however, it is insisted upon to be the fact in more southern latitudes, it may probably be occasioned by the combination of the Aurora with electric matter, which is not found in the north.

Since this paper was read at that excellent institution, the British Association for the advancement of Science, I have had the satisfaction of learning that several of its most distinguished members had made observations corroborative of my theory; among which I may mention those of W. L. Wharton, Esq., of Dryburn, Durham, who has kindly transmitted to me the copy

of an article he wrote in the *Durham Advertiser*, November, 1830. In this case, the Aurora was seen at eleven, P. M., when it was considerably to the westward of north at twelve (midnight), the summit of the luminous arch was due north. He adds, "Those who may have remarked the radiations of the Aurora have probably been struck by their similarity to those beams of light which radiate from the sun when partially observed by a cloudy atmosphere. They may also have observed with us that the radiations for the most part appear to proceed from that spot under the horizon in which the sun would be seen, if not concealed by the body of the earth, and that the summits of the accompanying arches of light are always seen directly above the same spot. Is it not then possible that the phenomena of the Aurora may originate in the light of the sun refracted at an immense elevation above us, after glancing over the nebulous strata of a distant part of the earth's atmosphere?"—In like manner, the registers of the Aurora in all the recent voyages to the Polar Regions corroborate my theory, although different conclusions, or conjectures, were hazarded respecting its nature and origin, and to which I must refer my readers as they are too numerous for insertion.

I may conclude by adding, that my theory has been submitted to the celebrated Professor Schumacher and others, who made no objections to it.

JOHN ROSS.

EXPLANATION OF THE PLATE.

A—The sun as at the Equinox.

B B—The points of incidence.

D D—Positions of the spectators.

C C—Clouds rendered visible by the reflected rays.

E—The earth as at the Equinox.

F F—The rays of the sun.

This diagram represents the sun's rays acting on the icy or snow-covered part of the earth, and being reflected over the poles reach clouds which are rendered visible by illumination; and having themselves reflecting qualities, distribute them upwards, downwards, or in any other direction, and owing to the rotation of the earth, are changing or steadfast according to the nature of the surface at the incidental point which first receives the rays.

NATURAL HISTORY

ACCOUNT
OF THE OBJECTS IN THE SEVERAL DEPARTMENTS OF
NATURAL HISTORY,

SEEN AND DISCOVERED DURING THE PRESENT EXPEDITION.

BY CAPTAIN JAMES CLARK ROSS, R.N., F.R.S., F.R.A.S., F.L.S., &c.

HAVING placed the department of Natural History under the exclusive charge of my Nephew, Captain J. C. Ross, whose acquirements in this branch of knowledge have been long known to the public, from the results of the former voyages in which he was engaged, I am indebted to him for the following pages; which have been drawn up by himself, with the assistance of those friends whom he has noticed in his own Preface.

JOHN ROSS.

PREFACE.

THE recent publication of the *Fauna Boreali Americana*, by Dr. Richardson, has rendered a detailed account of the Zoology of the Arctic Regions quite unnecessary. Nearly all the quadrupeds and birds that were met with in the course of our voyage in the *Victory* having fallen under the notice of that distinguished traveller and naturalist, they have there been described with accuracy, and illustrated by beautifully coloured engravings, so that nothing further is now left to be desired.

In the following brief notice the arrangement of Cuvier, in the *Règne Animal*, has been adopted, and in nearly all cases a reference is given to Dr. Richardson's descriptions in the *Fauna Boreali Americana*, and to the valuable Zoological notices appended to the several narratives of the Expeditions of Discovery to those Regions, under the command of Sir W. E. Parry and Sir John Franklin, where will be found all that is interesting both to the general reader and the naturalist.

I have much pleasure in expressing my obligations to Dr. Richardson for his observations on four species of Salmon brought home by me : his intimate acquaintance with the various species of that extensive and interesting genus inhabiting the lakes and

rivers of the North American Continent, will give a high value to that portion of the notice of the Fishes.

The rest of our collection having been necessarily abandoned with the Victory, a short and very imperfect account has been drawn up from my rough notes taken at the time, which, from my being but little acquainted with that branch of Natural History, is of course very defective.

To my friend Mr. Curtis, my warmest acknowledgments are due for his valuable remarks on the few Insects which I was able to bring to England, and the very beautiful drawings and engravings which accompany them.

The liberal and kind assistance I have received from Mr. Richard Owen, in drawing up the catalogue of the Marine Invertebrate Animals, requires my best thanks; particularly for his careful and elegant dissection of the new genus which he has named “*Rossia*,” peculiarly valuable at a time when the internal organization of the inferior orders of animated nature has become so extensively used in their classification.

J. C. R.

ZOOLOGY.

BY COMMANDER (NOW CAPTAIN) JAMES CLARK ROSS, R.N., F.R.S., F.L.S., &c.

1.—URSUS MARITIMUS (*Polar Bear*).

URSUS MARITIMUS.—*Cuv: Règ. An.*—vol. i., p. 137.

Rich: Faun. Bor. Amer.—p. 30.

Fab: Faun. Grænl.—p. 22.

Is found in greater numbers in the neighbourhood of Port Bowen, and Batty Bay, in Prince Regent's Inlet, than in any other part of the Polar Regions that I have visited in the course of the several expeditions of discovery. This circumstance, probably, arises from Lancaster Sound being but seldom covered by permanently fixed ice; and therefore affording them means of subsistence during the severity of an Arctic winter; and also from its being most remote from the usual winter residence of any of the Esquimaux, who alone dispute the sovereignty of the north with this monarch of its ferine inhabitants.

During our stay at Fury Beach many of these animals came about us, and several were killed. At that time we were fortunately in no want of provisions, but some of our party, tempted by the fine appearance of the meat, made a hearty meal off the first one that was shot. All that partook of it soon after complained of a violent headache, which, with some, continued two or three days, and was followed by the skin peeling off the face, hands, and arms; and in some, who had probably partaken more largely, off the whole body.

On a former occasion I witnessed a somewhat similar occurrence, when, on Sir Edward Parry's Polar journey, having lived for several days wholly on two bears that were shot, the skin peeled off the feet, legs, and arms of many of the party. It was

then attributed rather to the *quantity* than the *quality* of the meat, and to our having been for some time previous on very short allowance of provision. The Esquimaux eat its flesh without experiencing any such inconvenience; but the liver is always given to the dogs, and that may possibly be the noxious part. The Esquimaux of Boothia Felix killed several during their stay in our neighbourhood in 1830—all males.

The males are considerably larger than the females, as will be seen by the following measurements, being the average of nine males and seven females taken by myself:

	Male.	Female.
Length from snout to the end of the tail	94 inches	78.7 inches
snout to shoulder	33.5 . .	26.3
snout to occiput	18.4 . .	15.6
Circumference before the eyes	20.4 . .	15.8
at broadest part of the head	32.2 . .	28
at largest part of the abdomen	65.2 . .	57.6
Length of alimentary canal	61 feet	52 feet
Weight	900 lbs.	700 lbs.

The weight varies very much according to the season and condition of the animal.

The largest of the above measured 101.5 inches in length, and weighed 1028 lbs., although in poor condition.

2.—GULO LUSCUS (*Wolverene*).

GULO LUSCUS.—*Cuv: R^{eg}. An.*—vol. i., p. 141.

Rich: Faun. Bor. Amer.—p. 41.

Sab. in Supp. to Appx. to Parry's 1st Voy.—p. clxxxiv.

Kā ē wēēk.—Esquimaux of Boothia Felix.

Kab le a rioo.—Esquimaux of Melville Peninsula.

Some traces of the existence of this animal in the highest northern latitudes were observed on two of the preceding Arctic expeditions; but none of the animals were seen on either of those occasions: although we now know that it remains throughout the winter as far north as the 70° of latitude, and is not, like some other animals of that rigorous climate, subject to any change of colour from the most intense cold.

A few days previous to the arrival of the Esquimaux near Felix Harbour, in January, 1830, the tracks of this animal were first seen; and soon after, the skins of two old and two young ones were brought to the ship by the natives, who had taken them in traps built of stones.

During each of the following winters their tracks were occasionally seen, and at Victoria Harbour they were very numerous. There, in the middle of the winter, two or three months before we abandoned the ship, we were one day surprised by a visit from one, which pressed hard by hunger, had climbed the snow wall that surrounded our vessel, and came boldly on deck, where our crew were walking for exercise. Undismayed at the presence of twelve or fourteen men, he seized upon a canister which had some meat in it, and was in so ravenous a state that whilst busily engaged at his feast he suffered me to pass a noose over his head, by which he was immediately secured and strangled. By discharging the contents of two secretory organs, it emitted a most insupportable stench. These secretory vessels are about the size of a walnut, and discharge a fluid of a yellowish-brown colour, and of the consistence of honey, by the rectum, when hard pressed by its enemies.

The descriptions of authors are sufficiently accurate; but the following dimensions may be useful:

Length from snout to the insertion of the tail	. 28.4 inches
of the tail 9.8 (vertebræ)
of the hair of the tail 6

44.2 inches

Length from snout to shoulder 11.2 inches
to occiput 6.5
Extreme breadth of head 4.1
Circumference at ensiform cartilage 14.5
at neck 10.6
at broadest part of the head 13

Vertebrae—Cervical 7

Dorsal 15 (10 true and 5 false ribs)

Lumbral 5

Sacral 3 (now in one)

Caudal 15

It was a female, and weighed 27½ lb.

3.—MUSTELA ERMINEA (*Ermine*).

MUSTELA ERMINEA.—*Cuv: Règ. Anim.*—vol. i., p. 145.

Rich: Faun. Bor. Amer.—p. 46.

These beautiful and elegant little animals were by no means numerous; but their tracks were occasionally seen during the winter, following those of the Lemmings, upon which they chiefly subsist during that inclement part of the year. It is almost impossible to tame them, preferring rather to die than live in confinement. One that came on board of our ship and was taken, although treated with the greatest kindness, its restless and vicious nature so completely exhausted it, that it died at the end of a week or ten days. The Ermine assumes its winter dress early in September, and again changes to brown towards the end of May. It is the great enemy of the Lemming, and in its turn is preyed upon by the Fox.

It is 18 inches long, and weighs $5\frac{1}{2}$ oz.

4.—CANIS LUPUS OCCIDENTALIS (*American Wolf*).

CANIS LUPUS.—*Cuv: Règ. Anim.*—vol. i., p. 150.

CANIS LUPUS OCCIDENTALIS.—*Rich: Faun. Bor. Amer.*—p. 60.

Considerable numbers of this animal were seen on the narrow Isthmus of Boothia, where they arrive early in the spring to intercept the Reindeer on their way to the north. None were killed by us during our late voyage, owing to their extreme wariness; but their tracks were occasionally seen during each of the winters. They are very troublesome to the Esquimaux, robbing their hoards, tearing the skin covering off their canoes, and killing their dogs. It is a remarkable circumstance, that a single wolf will go amongst any number of Esquimaux dogs, and carry off any one from amongst them without the others attempting to attack it. Such is their extreme dread of the Wolf, that they begin to tremble and howl whenever they are aware of its approach. The Wolf will seldom attack a man, except when starving; but if alone and unarmed, it will not care to get out of his way.

A pair kept for the purpose of watching the changes of their fur, threw off their winter dress during the first week in June; the female a few days earlier than the male. Towards the end of September the brown fur of summer gradually became of an ash colour, and by the middle of October was perfectly white: from that period it continued rapidly to increase in thickness until the end of November, when the last of the two died, having lived in confinement nearly ten months.

The flesh of the young Fox is white, and well flavoured. Dr. Richardson says, "Captain Franklin's party agreed with Hearne in comparing the flavour of a young Arctic Fox to that of the American Hare." Captain Lyon considered it to "resemble the flesh of the kid;" whilst those of our party, who were the first to taste them, named them "lambs," from their resemblance in flavour to very young lamb. The flesh of the old Fox is by no means so palatable; and the water it is boiled in becomes so acrid as to excoriate the mouth and tongue. During our late expedition, they constituted one of the principal luxuries of our table, and were always reserved for holidays and great occasions. We ate them boiled—or more frequently after being parboiled, *roasted* in a pitch kettle.

They were taken by us in considerable numbers, and formed a valuable addition to our provisions when meat was very scarce.

The females are somewhat smaller than the males, and generally in poorer condition.

The average weight of twenty males being 7 lb. 4 oz.; of twenty females, 5 lb. 11 oz.

	Males.	Females.
Length from snout to insertion of tail .	22.4 inches	21.8 inches
to end of vertebrae of tail	35	33.5
Length of fur in each 2.7 inches beyond the vertebrae of the tail.		
Length of the head measured with callipers	5.5 inches	
Mean length of the alimentary canal :	85.7	
of the intestinum caecum	4.5	

6.—CANIS LAGOPUS (*Var. β . Fuliginosus*).

CANIS LAGOPUS FULIGINOSUS.—*Rich: Faun. Bor. Amer.*—p. 89.

This variety of the Arctic Fox is much more rare than the preceding, only three individuals having been captured out of fifty of the pure white kind. Indeed in a

country which presents an unvaried white surface, they must have extreme difficulty in surprising their prey, and be much more exposed to the persecutions of its enemies.

It is somewhat larger in its measurements than the white variety.

	Male.
Length from snout to insertion of the tail .	23.7 inches
to end of vertebræ of the tail . .	36.2
of the head measured with callipers	5.7

7.—ARVICOLA HUDSONIA (*Hudson's Bay Lemming*).

LEMMUS HUDSONIUS.—*Cuv: Règ. Anim.*—vol. i., p. 207.

ARVICOLA HUDSONIA.—*Rich: Faun. Bor. Amer.*—p. 132.

Rich: App. to Parry's 2d Voy.—p. 308.

The smallest of the quadrupeds of the Polar Regions, and has been found in the highest latitude that has yet been attained: even on the ice of the Polar Ocean, to the northward of the 82° of latitude, the skeleton of one was found.*

It has never been met with far in the interior of the country, preferring to congregate during the summer months along the sea-shores, where amongst large loose stones they rear their young, and find shelter from their numerous enemies. In the winter season, each individual makes a nest of dried grass, on the surface of the earth, beneath the snow, and has many passages in different directions from its nest, along which it passes in search of food. It seldom appears during the winter, but its tracks are occasionally to be met with even in the coldest weather; but from the whiteness of its fur, and the rapidity with which it burrows beneath the surface of the snow, it is seldom taken at that season of the year.

It feeds chiefly on the roots of *Polygonum Viviparum*, on grasses, vetches, and during the summer on almost every kind of plant the country produces; but is nevertheless fond of animal food, even to devouring its own species; and the salmon hoards of the Esquimaux frequently furnish provision to numbers of these animals during the winter.

* See Appendix to Parry's Polar Journey, p. 190.

It brings forth from four to eight young at various periods of the year: thus one taken by us in March had four young *in utero*, nearly matured; and a nest with six young ones, blind, naked, and helpless, was found on 12th July; they abandoned their nest on the 22d.

It is easily tamed, and fond of being caressed; one that had been but a few days confined, escaped during the night, and was found next morning on the ice alongside the ship: on putting down its cage, which it recognised in the servant's hand, it immediately went into it. It lived for several months in the cabin; but finding that, unlike what occurred to our tame hares under similar circumstances, it retained its summer fur, I was induced to try the effect of exposing it for a short time to the winter temperature.

It was accordingly placed on deck in a cage, on the 1st of February; and next morning, after having been exposed to a temperature of 30° below zero, the fur on the cheeks and a patch on each shoulder had become perfectly white. On the following day the patches on each shoulder had extended considerably, and the posterior part of the body and flanks had turned to a dirty white: during the next four days the change continued but slowly, and at the end of a week it was entirely white, with the exception of a dark band across the shoulders, prolonged posteriorly down to the middle of the back, forming a kind of saddle, where the colour of the fur had not changed in the smallest degree. The thermometer continued between 30° and 40° below zero until the 18th, without producing any further change, when the poor little sufferer perished from the severity of the cold.

On examining the skin, it appeared that all the white parts of the fur were longer than the unchanged portions; and that the ends of the fur only were white, so far as they exceeded in length the dark-coloured fur; and by removing these white tips with a pair of scissors, it again appeared in its dark summer dress, but slightly changed in colour, and precisely the same length as before the experiment.

8.—ARVICOLA TRIMUCRONATA (*Back's Lemming*).

ARVICOLA TRIMUCRONATA.—*Rich: App. to Parry's 2d Voy.*—p. 309.

Although seen by us on the coast of Boothia Felix in considerable numbers, it is not so generally to be met with in the Arctic Regions as the preceding species.

The individual specimen from which Dr. Richardson's very accurate description was drawn, was taken by Captain Back (in honour of whom it has been named) on Point Lake, in latitude 65° N. It was a female of smaller dimensions than those we have generally met with; for Dr. Richardson states it to be a little *inferior* in size to the Hudson's Bay Lemming: whereas a comparison of the average measurements and weight of above twenty of each species is in favour of the latter.

No specimens of this species were obtained during the winter; but it is more than probable that, like the preceding species, it is white during that season.

The first fur of the young, as in the Hudson's Bay Lemming, is rather more obscure than that of the parents; and even in this early state the two species are easily distinguishable by their colour, the trimucronate thumb not being at first so very apparent.

9.—ARCTOMYS PARRYI (*Parry's Marmot*).

ARCTOMYS PARRYI.—*Sab: in App. to Franklin's 1st Journey.*

Rich: in App. to Parry's 2d Voy.

Rich: in Faun. Bor. Amer.—p. 158.

None of these animals were seen during our late voyage in the Victory; nor do I believe they have ever been found far north of the Arctic Circle. I notice it here merely to mention that some of the dresses of the Esquimaux who had lately left Repulse Bay were made of its skins. These people told us that it was very numerous in those parts.

10.—LEPUS GLACIALIS (*Polar Hare*).

LEPUS GLACIALIS.—*Rich: Faun. Bor. Amer.—p. 221.*

LEPUS TIMIDUS.—*Fab: Faun. Grænl.—p. 25.*

There is scarcely a spot in the Arctic Regions, the most desolate and steril that can be conceived, where this animal is not to be found, and that too throughout the winter:

nor does it seek to shelter itself from the inclemency of the weather by burrowing in the snow, but is found generally sitting solitary under the lee of a large stone, where the snow-drift as it passes along seems in some measure to afford a protection from the bitterness of the blast that impels it, by collecting around and half burying the animal beneath it.

It is accordingly provided with a remarkably fine, thick, woolly fur, admirably calculated to withstand the most intense cold.

In summer it is found chiefly at the foot and sides of gentle acclivities, where amongst the large loose stones it finds some secure retreat to bring forth its young. A female killed by one of our party at Sheriff Harbour, on the 7th of June, had four young *in utero*, perfectly mature, $5\frac{1}{2}$ inches long, and of a dark gray colour. In one shot by us at Igloodik, on the 2d of June, six young were found, not quite so far advanced; and Fabricius, who states that he has himself seen eight young *in utero*, says it brings forth many young towards the end of June. One taken by us on the 28th of June a few days after its birth, soon became sufficiently tame to eat from our hands, and was allowed to run loose about the cabin. During the summer, we fed it on such plants as the country produced, and stored up a quantity of grass and astragali for its winter consumption; but it preferred to share with us whatever our table could afford, and would enjoy pease soup, plum pudding, bread, barley soup, sugar, rice, and even cheese, with us. It could not endure to be caressed, but was exceedingly fond of company, and would sit for hours listening to a conversation, which was no sooner ended than he would retire to his cabin: he was a continual source of amusement by his sagacity and playfulness, until in the middle of winter, when playing some of his pranks, he struck his head against one of the beams, and was ever after subject to fits. He lived and thrived nevertheless throughout the winter, and died in the following summer after fifteen months' confinement.

Although constantly in a temperature never much below the freezing point, its fur assumed its white colour as early as those that were running wild, and exposed to the climate; and although it cast its winter coat early in May, it was replaced by a pure white fur; from which, it is probable that the old males are not subject to the same change as the females in summer. Fabricius says, that "the Greenland Hare is white both in summer and winter." Amongst the inhabitants of Greenland, one Esquimaux woman was found who spun some of the beautiful white wool of the Hare into a thread, and knitted several pairs of gloves; one pair of which, notwithstanding the native filthiness of the Esquimaux, came into my possession beautifully white. It very much resembles the Angola wool, but is still more soft.

11.—CERVUS TARANDUS (*Reindeer*).

CERVUS TARANDUS.—Cuv: *Règ. Anim.*—vol. i., p. 261.

Rich: *Faun. Bor. Amer.*—p. 238.

Rich: *App. Parry's 2d Voy.*—p. 326.

Although this animal was seen in great numbers on the Isthmus of Boothia, only one individual was killed in the course of our late voyage. It was a fine buck, of larger size than ordinary, and weighed 250 lb.; the average of those killed at Spitzbergen and Melville Island did not exceed half that weight.

The does arrived about the middle of April, the bucks nearly a month later; and herds of several hundreds were seen about the Isthmus towards the end of May. Numbers of the fawns, which at that period are in a very weak state, are killed by the natives, who hunt them with their dogs; and the does themselves often fall victims to their attachment to their offspring.

The natives of Boothia depend chiefly on the skins of these animals for their beds and clothing; their bows and spears are principally made from their horns, which being softened by steeping in water are easily cut into shape, even with their rude knives; and the sinews of the Reindeer make the best thread. The paunch, termed by them *ner-rook-kah*, is esteemed a great delicacy; and its contents is the only vegetable food which the natives ever taste.

It feeds on the *usnæ*, *alectoriæ*, *cetrariæ*, and other lichens in the early part of spring; but as the summer advances, the young and tender grass fattens it so quickly, that in August they have been killed with several inches thick of fat on their haunches. In this state the meat is equal to the finest English venison; but is most tasteless and insipid when in poor condition.

Dr. Richardson *loc. cit.* has given a most detailed and interesting account of the several uses to which every part of this animal is put, and the various ways by which it is captured or killed in different parts of the American continent.

The natives of Boothia seldom hunt it in the spring, and then the bow and arrow is their only mode of killing it; but in the autumn, as the animal returns from the north in fine condition, they are destroyed in great numbers by parties of the natives driving them into the water, whilst others in canoes kill them with spears at their leisure.

Although they migrate, towards the middle of September, to milder climes, yet stragglers are occasionally seen in the winter.

Length from snout to insertion of tail	.	70 inches
length of tail	.	5.2
hair of the tail	.	2

Extreme length . . 77.2

Height at fore shoulder	.	.	51 inches

12.—OVIPOS MUSCHATUS (*Musk Ox*).

OVIPOS MUSCHATUS.—*Rich: Faun. Bor. Amer.*—p. 271.

BOS MUSCHATUS.—*Cuv: Règ. Anim.*—p. 281.

Sabine, in App. to Franklin's 1st Journey—vol. i., p. 668.

Rich: in App. to Parry's 2d Voy.—p. 331.

MUSK OX.—*Hearne's Journey*—p. 137. *Pennant, Arctic Zool.*—vol. i., p. 9.

Oo ming mak.—Esquimaux.

The circumstance of this animal and the Reindeer having been found in Melville Island, led to the belief that a chain of islands, at no great distance from each other, connected Melville Island with the shores of the continent. The recent discovery of the Isthmus of Boothia, and the fact that the continent of America extends to the 74th degree of north latitude, affords an easy solution of the route by which this animal visits the North Georgian Islands. They are said by the natives to be very numerous between the Isthmus of Boothia and Repulse Bay; but are not found to the westward, the whole country being of low limestone formation, whilst the rugged granite hills are the favourite resort of the Musk Ox.

On one of my surveying excursions from the ship, in April, 1830, we were fortunate in meeting with two of these animals, which we killed; they were both males, in very fine condition. We found the meat most excellent food, and quite free from any musky

flavour, although the skin smelt strongly of it. The account of the manner in which the natives hunt this animal will be found in the narrative.

The Esquimaux informed us, that at Aw-wuk-too-teak the Musk Ox is frequently seen in considerable numbers. It is not so highly valued by them as the Reindeer; its hide being too thick and hard for clothing, is used only for beds.

The dung of the Musk Ox, as well as of the Reindeer, when fresh, is considered a delicacy by the natives.

There is an excellent drawing of the Musk Ox in Captain Parry's Narrative of his First Voyage, p. 257, by Lieut. Beechy. The description by Dr. Richardson is most accurate; and a very fine specimen brought from Melville Island is preserved in the British Museum.

13.—PHOCA FŒTIDA (*Rough Seal*).

PHOCA FŒTIDA.—*Cuv : Règ. Anim.*—vol. i., p. 168.

Fab : Faun. Græul.—p. 13.

Rich : App. to Parry's 2d Voy.—p. 332.

ROUGH SEAL.—*Penn : Quad.*—vol. ii., p. 278; and *Arctic Zool.*—vol. i., p. 160.

Inhabits the seas both on the east and west sides of the Isthmus of Boothia, and constitutes the principal means of subsistence to the inhabitants during eight or nine months of every year.

In July, August, and September, the Reindeer and Salmon afford to the Esquimaux an agreeable and salutary change. The skins of the Reindeer supply them with beds and clothes; but it is the Rough Seal on which they wholly depend for their winter's food; when all other animals have retired to a more temperate climate, the Seal is sought by the Esquimaux, whose dogs are trained to hunt over the extensive floes of level ice, and to scent out the concealed breathing-holes of the Rough Seal. So soon as one is discovered, a snow wall is built round it, to protect the huntsman from the bitterness of the passing breeze; where, with his spear uplifted, he will sit for hours until his victim rises to breathe, and falls an easy sacrifice to his unerring aim. In this manner, a party of thirty hunters killed 150 of these animals during the first two months they remained in our neighbourhood; the fishery for ten or twelve miles

round was then completely exhausted ; so they broke up into several smaller parties, and dispersed in various directions. In the month of May, the Rough Seal, with its young, lie basking in the sun, close to holes in the ice, and are at that time very difficult to approach ; but the natives imitate both their cry and action so exactly as to deceive the animals until they get sufficiently near to strike them with their spear. Fabricius says, it is the most heedless of all the Seals, as well on the ice as in the water : from our experience, we would certainly give them a very different character, for none of our sportsmen were ever able to get sufficiently near to shoot them. The natives of Boothia say they are not in their prime until the third year ; and we never heard them complain of the offensive smell, which their more fastidious brethren in Greenland are said to dislike so extremely. The blood of the Rough Seal answers all the purposes of glue.

The Rough Seal resembles our common Seal, *P. Vitulina*, the principal differences being in the more diminutive size of the *P. Fœtida*, its being clothed with a more woolly coat, and some slight differences in its colour ; all of which may indeed be fairly attributed to difference of food and climate.

The average length from the snout to the extremity of the tail, of twenty measured by me, was 55 inches, the hind flippers extending 9 inches beyond the end of the tail ; and the average weight of the same number was 199 lb. : the circumference immediately behind the fore-flippers being 49.7 inches. The females are larger than the males.

The average length of the young, when between five and six months old, was 38 inches ; the weight 49 lb. ; circumference as above, 28.6 inches ; length of the alimentary canal, 49 feet 8 inches ; and of the cæcum, $3\frac{1}{4}$ inches.

It feeds chiefly on the *Mysis fluviatilis* and other small *Cancrini*.

14.—PHOCA GRŒNLANDICA (*Harp Seal*).

PHOCA GRŒNLANDICA.—Cuv : *Règ. Anim.*—vol. i., p. 168.

Egede, Grœnl.—p. 62, fig. A.

HARP SEAL.—Penn : *Arct. Zool.*—vol. i., p. 163.

Kai ro lik.—Esquimaux of Boothia.

Unlike the preceding species, it is seldom met with on the fixed ice of the bays and inlets, but prefers the loose floating flocs which constitute what is termed by the whale

fishers "the middle ice" of Baffin's Bay and Davis Straits. It is, however, occasionally met with near the coast of Greenland.

We have never seen it in any part of Prince Regent's Inlet; but from the natives of Boothia we obtained several skins of this Seal, which they describe as being sometimes very numerous on the west side of the Isthmus, but is much more scarce than the preceding species. They have never seen any of this species on the east side of the Isthmus of Boothia.

15.—PHOCA BARBATA (*Great Seal*).

PHOCA BARBATA.—Cuv: *Règ. Anim.*—vol. i., p. 168.

Fab: Faun. Grænl.—p. 15.

Oo ge ook.—Esquimaux.

Is the largest of the Seals inhabiting the Polar Seas. It is but seldom sought after by the natives of Boothia, as it approaches the shores only in the summer season, when the salmon fishery wholly engrosses their attention. In winter it seeks those parts of the Arctic Ocean which are seldom, if ever, frozen over for any length of time.

No specimens were obtained.

16.—TRICHECHUS ROSMARS (*Walrus*).

TRICHECHUS ROSMARS.—Cuv: *Règ. Anim.*—vol. i., p. 171.

Fab: Faun. Grænl.—p. 11.

I we ak.—Esquimaux.

Inhabits the west coast of Baffin's Bay, and is occasionally seen in the northern part of Prince Regent's Inlet, but the natives of Boothia have never seen a Walrus; and

although we found amongst them several articles made from the tusks of that animal, they were all brought from Repulse Bay, where it abounds.

No specimens were obtained.

17.—DELPHINAPTERUS BELUGA (*White Whale*).

DELPHINAPTERUS BELUGA.—*Cuv: Règ. Anim.*—vol. i., p. 290.

DELPHINUS ALBICANS.—*Fab: Faun. Grænl.*—p. 50.

Scoresby's Arctic Regions—vol. ii., pl. xiv.

Seen abundantly in Prince Regent's Inlet, but none were taken by us.

18.—MONODON MONOCEROS (*Narwhal*).

MONODON MONOCEROS.—*Cuv: Règ. Anim.*—vol. i., p. 292.

Fab: Faun. Grænl.—p. 29.

Scoresby's Arctic Regions—vol. ii., pl. xv.

The Narwhal, or Sea Unicorn, though occasionally seen in great numbers in the upper part of Baffin's Bay and Prince Regent's Inlet, are but seldom killed, from the great difficulty of surprising them when sleeping on the surface of the water, and the very short time they remain up when they rise to breathe.

The oil produced from its blubber is considered superior to that of the Whale; and the horn is valuable. Two or three years ago, several hundreds of these animals were found dead along the west coast of Baffin's Bay by the vessels employed in the whale-fishery; and I was informed by Captain Humphreys, of the *Isabella*, that of a great many examined by him, the males only have the horn-shaped spiral tooth.

Fabricius says, that both male and female have this horn; and that sometimes, but very seldom, the male has two of equal size. A specimen of this may be seen in the

valuable museum of the Royal College of Surgeons; and an account of a female Narwhal, which had a horn similar to the male, is given in the 13th volume of the Transactions of the Linnæan Society, p. 620; but both these cases are of rare occurrence.

The largest horn I have seen measured $8\frac{1}{2}$ feet. In all the males the rudiments of a second horn or tooth is present; and in the female are two such rudimental teeth, each about 8 inches in length.

A female killed in June had one young *in utero*, nearly matured, of a bluish-brown colour, nearly 5 feet long.

Several skeletons of this animal were seen by us as we travelled along the eastern coast of the Peninsula of Boothia, but only one horn was found amongst them; it measured 7 feet in length, $9\frac{1}{2}$ inches in circumference at its insertion, and weighed 14lb. 6oz.

19.—BALÆNA MYSTICETUS (*Black Whale*).

BALÆNA MYSTICETUS.—Cuv: *Règ. Anim.*—vol. i., p. 296.

Fab: *Faun. Grænl.*—p. 32.

Scoresby's *Arctic Regions*—vol. ii., pl. xii.

The capture of the Whale, which gives employment to several thousands of our seamen, and has annually produced, on an average of the last twenty years, between eleven and twelve thousand tons of oil, and from five to six hundred tons of whalebone; has of late years greatly declined, owing to the increasing difficulties attending the fishery. Wearied by the incessant persecutions of man, the Whale has lately abandoned all the accessible parts of the Spitzbergen Sea, where it was by no means unusual to see sixty or seventy sail of British vessels engaged in its capture.

On the east side of Baffin's Bay, as far as the 72° of latitude, abundance of Whales of a large size were to be found, some few years ago; but, like the fishery in the Spitzbergen Sea, this also was deserted. The Whales retired to the westward of the then considered impenetrable barrier of ice that occupies the middle of Baffin's Bay.

In 1818 that barrier was passed by the first Expedition of Discovery, sent by the government to those regions; where the haunts of the Whale and the nursery for its young were laid open to the fishermen, whose daring enterprise and perseverance in following

the track of the discoverers, were amply rewarded for the first few years by most abundant success; since the produce that in any one year has been brought to England from those newly-discovered portions of the Arctic Seas, is more than sufficient to cover the whole expenses of all the Expeditions of Discovery that have been sent, during the last twenty years, to those regions: and yet people, not aware of this circumstance, are perpetually asking what benefit can result to this country from such undertakings!

The Whale, however, still continues to retire from the persecutions of man; and the numbers of its young which are annually destroyed without remorse by the avaricious but imprudent fishermen, must soon exhaust the fishery; and search must then be made far to the westward of Baffin's Bay, and to the eastward of Spitzbergen, for their places of retreat.

We found them in considerable numbers as low as the latitude of 71° N, along the western shore of Prince Regent's Inlet; and the whole line of coast is crowded with the remains of Esquimaux winter huts, which had been chiefly constructed of the crown bones of the young Whale.

The natives of the Isthmus of Boothia say, that it is but rarely seen either on the east or west side of the Isthmus; and they, not being sufficiently well prepared, or in sufficient numbers, never venture to attack it. Only two were seen by us during the three years we were frozen up in that neighbourhood.

A most interesting account of the Whale fishery is given by Captain Scoresby, *loc. cit.*, where its importance to Great Britain, as a nursery for seamen, employment of capital, and as a source of national wealth, is made sufficiently manifest.

B I R D S.

1.—FALCO ISLANDICUS (*Jerfalcon*).

FALCO ISLANDICUS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 27. *Lath : Ind. Orn.*—vol. i., p. 32.

Cuv : Règ. Anim.—vol. i., p. 323.

Sub : Greenl. Birds, in Trans. Lin. Soc.—vol. xii., p. 528. *Temm.*—vol. i., p. 17.

WHITE JERFALCON.—*Lath : Syn.*—vol. i., p. 83; and *Supp.*—p. 21.

Several were seen about Victoria Harbour, pursuing the packs of young Grouse, in August and September, 1832; and a pair built their nest a short distance to the south of Felix Harbour. No specimens, however, were obtained by us.

2.—STRIX NYCTEA (*Snowy Owl*).

STRIX NYCTEA.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 88. *Lath : Ind. Orn.*—vol. i., p. 57.

Cuv : Règ. Anim.—vol. i., p. 345. *Temm.*—vol. i., p. 82.

Fab : Faun. Grænl.—p. 60; and in *Appendices to Parry's 1st, 2d, and 3d Voyages.*

SNOWY OWL AND WHITE OWL.—*Arct. Zool.*—vol. ii., p. 233. *Lath : Syn.*—vol. i., p. 132.

Was occasionally seen throughout the winter about Victoria Harbour, where several pairs had bred in the preceding autumn, but none were obtained by us.

3.—*ALAUDA CORNUTA* (*Shore Lark*).

ALAUDA CORNUTA.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 245.

ALAUDA ALPESTRIS.—*Forst: Phil. Trans.*—lxii., p. 398. *Lat: Ind. Orn.*—vol. ii., p. 498.

Cuv: Rêg. Anim.—vol. p. 400. *Temm.*—vol. i., p. 279.

Rich: App. to Parry's 2d Voyage—p. 343.

SHORE LARK.—*Penn: Arct. Zool.*—vol. ii., p. 392.

One shot by us, near Felix Harbour, agreed well with the descriptions of authors. Two others were all that were seen by us; it is therefore but rarely met with above the 70° of latitude.

4.—*SYLVIA CENANTHE* (*Wheatear*).

SYLVIA CENANTHE.—*Temm.*—vol. i., p. 135. *Lath: Ind. Orn.*—vol. ii., p. 529.

Saline, in Trans. Linn. Soc.—vol. xii., p. 531.

MOTACILLA CENANTHE.—*Cuv: Rêg. Anim.*—vol. i., p. 382.

Fab: Faun. Græc.—p. 122.

WHEATEAR.—*Lath: Syn.*—vol. iv., p. 465. *Arct. Zool.*—vol. ii., p. 420.

One of these little birds was observed flying round the ship in Felix Harbour on the 2d of May, 1830, and was found dead alongside, the next morning: having arrived before the ground was sufficiently uncovered to enable it to procure its food, it had perished from want. It is the only instance of this bird having been met with in Arctic America, in the course of our several Expeditions to those regions.

I do not find it mentioned by Dr. Richardson, in the “*Fauna Boreali Americana*.” Fabricius found it in Greenland; and several were seen by us, on our first voyage, off Cape Farewell, in October, 1818.

5.—*EMBERIZA NIVALIS* (*Snow Bunting*).

- EMBERIZA NIVALIS*.—*Rich*: *Faun. Bor. Amer.*—vol. ii., p. 246. *Lath*: *Ind. Orn.*—vol. i., p. 397.
Cuv: *Rég. Anim.*—vol. i., p. 405. *Temm.*—p. 319. *Gmel.*—vol. i., p. 866.
Fab: *Faun. Grænl.*—p. 117. *Sabine*, in *Trans. Linn. Soc.*—vol. xii., p. 532.
Rich: in *App. to Parry's 2d Voyage*.—p. 343.
SNOW BUNTING.—*Brit. Zool.*—vol. i., p. 444. *Arct. Zool.*—vol. ii., p. 355.
Lath: *Syn.*—vol. iii., p. 161.

Abounds in all parts of the Arctic Regions, between the middle or end of April and the end of September.

6.—*PLECTROPHANES LAPPONICA* (*Lapland Finch*).

- PLECTROPHANES LAPPONICA*.—*Ross*, in *App. to Parry's 3d Voyage*—p. 97.
Selby, in *Trans. Linn. Soc.*—vol. xv., p. 156, pl. 1 (young).
Rich: *Faun. Bor. Amer.*—p. 248, pl. 48 (excellent).
PLECTROPHANES CALCARATA.—*Meyer*: *Tusch.*—vol. iii., p. 176.
EMBERIZA CALCARATA.—*Temm.*—vol. i., p. 322. *Rich*: in *App. to Parry's 2d Voyage*—p. 345.
LAPLAND FINCH.—*Arct. Zool.*—vol. ii., p. 377. *Lath*: *Syn.*—vol. iii., p. 263.

Is by no means numerous in the higher northern latitudes. A nest with five eggs was brought on board early in July, 1830.

7.—*CORVUS CORAX* (*Raven*).

- CORVUS CORAX*.—*Rich*: *Faun. Bor. Amer.*—vol. ii., p. 290. *Lath*: *Ind. Orn.*—vol. i., p. 150.
Cuv: *Rég. Anim.*—vol. i., p. 420.—*Temm.* p. 107. *Gmel.*—vol. i., p. 364.
[*Fab*: *Faun. Grænl.*—p. 62. *Rich*: *App. to Parry's 2d Voyage*—p. 343.]
Ross, *App. to Parry's 3d Voyage*—p. 97.
RAVEN.—*Lath*: *Syn.*—vol. i., p. 367. *Arct. Zool.*—vol. ii., p. 245.

This is one of the few birds that are capable of braving the severity of an Arctic

winter and of enduring the scorching rays of a tropical sun, without any change being produced in its plumage by the extremes of climate. Cuvier and other authors mention, that in the north it is frequently found more or less white: we never saw any thing corroborative of such an observation. It preserves its plumage and peculiar characteristics, unchanged, in every part of the globe.

8.—TETRAO LAGOPUS MUTUS (*Ptarmigan*).

TETRAO LAGOPUS MUTUS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 350.

TETRAO LAGOPUS.—*Cuv: Règ. Anim.*—vol. i., p. 482. *Lath: Ind. Orn.*—vol. ii. p. 639.

Fab: Faun. Græc.—p. 114. *Sab: Supp. to Parry's 1st Voyage*—p. cxcvii.

Rich: App. to Parry's 2d Voyage—p. 350.

Ross, App. to Parry's 3d Voy.—p. 99; and *App. to Parry's Polar Voy.*—p. 193.

PTARMIGAN.—*Brit. Zool.*—vol. i., p. 359, pl. 57. *Lath: Syn.*—vol. iv., p. 744. *Arct. Zool.*—p. 315.

Is not so numerous in the higher northern latitudes as the two following species. A pair was shot on the east side of the Peninsula of Boothia, in latitude 71° nearly; and three or four more were obtained at Felix Harbour.

9.—TETRAO LAGOPUS SALICETI (*Willow Grouse*).

TETRAO LAGOPUS SALICETI.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 351.

TETRAO SALICETI.—*Cuv: Règ. Anim.*—vol. i., p. 483. *Temm.*—vol. ii., p. 471.

Sabine, App. to Franklin's 1st Journey—p. 681.

Rich: App. to Parry's 2d Voyage—p. 347.

TETRAO ALBUS.—*Lath: Ind. Orn.*—vol. ii., p. 639. *Gmel.*—vol. i., p. 750.

Ross, App. to Parry's 3d Voyage—p. 101.

WHITE GROUSE.—*Lath: Syn.*—vol. iv., p. 743. *Arct. Zool.*—vol. ii., p. 308.

WILLOW PARTRIDGE.—*Hearn's Travels*—p. 338.

Inhabits both shores of the inlet to the west of Boothia; but is not to be found on

the east side of the Peninsula, seeming to prefer the low limestone formation to that of the high rugged granite, which appears more peculiarly adapted to the habits of the Rock Grouse and the Ptarmigan.

10.—TETRAO LAGOPUS RUPESTRIS (*Rock Grouse*).

TETRAO LAGOPUS RUPESTRIS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 354, pl. 64, fem.

TETRAO RUPESTRIS.—*Sub : Supp. to Parry's 1st Voyage*—p. cxcv.

Rich : App. to Parry's 2d Voyage—p. 348.

Ross, App. to Parry's 3d Voyage—p. 99.

Lath : Ind. Orn.—vol. ii., p. 640. *Gmel.*—vol. i., p. 751.

ROCK GROUSE.—*Arct. Zool.*—vol. ii., No. 184. *Lath : Syn. Supp.*—p. 217.

Is much more numerous in the higher northern latitudes than either of the two preceding species. It frequents the eastern side of the Peninsula of Boothia; but was not found to the westward.

11.—COLUMBA MIGRATORIA (*Passenger Pigeon*).

COLUMBA MIGRATORIA.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 363.

Sub : App. to Franklin's Journey—p. 679.

Cuv : Règ. Anim.—vol. i., p. 488.

Forster, in Phil. Trans. Roy. Soc.—vol. lxii., p. 398.

PASSENGER PIGEON.—*Arct. Zool.*—vol. ii., p. 322.

A young male bird flew on board the *Victory* during a storm, whilst crossing Baffin's Bay in latitude $73\frac{1}{2}^{\circ}$ N, on the 31st of July, 1829. It has never before been seen beyond the sixty-second degree of latitude; and the circumstance of our having met with it so far to the northward, is a singular and interesting fact.

It is well known, from the dreadful devastation it commits in the rice-fields of America; and the accounts which authors give of the inconceivable multitudes that occasionally assemble together, are quite incredible. See Wilson's "*American Ornithology*," vol. ii., p. 299.

12.—CHARADRIUS SEMIPALMATUS (*American Ring Plover*).

- CHARADRIUS SEMIPALMATUS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 367.
 CHARADRIUS HIATICULA.—*Temm.*—p. 539. *Cuv : Règ. Anim.*—vol. i., p. 501.
Sabine, in Franklin's Journey—p. 684.
Sab : Supp. to Parry's 1st Voyage—p. cc.
Rich : App. to Parry's 2d Voyage—p. 351.
Sab : in Trans. Linn. Soc.—vol. xii., No. 10.

Very numerous during the summer months in Boothia, inhabiting the marshy grounds, and feeding chiefly on the larvæ of the *Tipula Arctica* (of Curtis).

13. CHARADRIUS PLUVIALIS (*Golden Plover*).

- CHARADRIUS PLUVIALIS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 369.
Cuv : Règ. Anim.—vol. i., p. 501. *Lath : Ind. Orn.*—vol. ii., p. 740.
Gmel.—vol. i., p. 688. *Fab : Faun. Græul.*—No. 79.
Temm.—vol. ii., p. 535. *Sabine, Franklin's Journey*—p. 683.
Sabine, Supp. to Parry's 1st Voyage—p. cxcix.
Ross, App. to Parry's 3d Voyage—p. 683.
 GOLDEN PLOVER.—*Arct. Zool.*—vol. ii., p. 483.

Abundant during the breeding season in most parts of the Arctic Regions. We found them plentifully in the neighbourhood of Felix Harbour, feeding in the marshes, in company with the preceding species.

14.—VANELLUS MELANOGASTER (*Grey Lapwing*).

- VANELLUS MELANOGASTER.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 370.
Cuv : Règ. Anim.—vol. i., p. 502.
Sabine, Franklin's Journey—p. 684.
Rich : App. to Parry's 2d Voyage—p. 352.
 SWISS SANDPIPER.—*Arct. Zool.*—vol. ii., p. 478.

Is somewhat larger than the Golden Plover, with which it has been frequently

confounded. It is also more rarely met with ; but was found by us breeding near the margins of the marshes immediately to the south-west of Fury Point, in considerable numbers.

Some specimens were also obtained near Felix Harbour.

15.—STREPSILAS INTERPRES (*Turnstone*).

STREPSILAS INTERPRES.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 371. .

Cuv : Règ. Anim.—vol. i., p. 529.

STREPSILAS COLLARIS.—*Temm.*—vol. ii., p. 553. *Sabine, Franklin's Journey*—p. 684.

Sab : Supp. to Parry's 1st Voyage—p. cc.

Rich : App. to Parry's 2d Voyage—p. 352.

TURNSTONE.—*Edwards*—pl. 141.

Is still more rare than the preceding, and only one specimen was obtained, early in July, at Felix Harbour ; it was a female in full breeding plumage. Some others were seen by us, as we travelled along the coast between Victoria Harbour and Fury Point, about the middle and towards the end of June.

16.—GRUS CANADENSIS (*Brown Crane*).

GRUS CANADENSIS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 373. *Cuv : Règ. Anim.*—vol. i., p. 510.

BROWN CRANE.—*Penn : Arct. Zool.*—vol. ii., p. 443.

Several individuals of a species of Crane were seen by us in the neighbourhood of Fury Beach ; they were probably of the abovenamed species, but as no specimen was obtained, it cannot be identified with certainty.

17.—TRINGA MARITIMA (*Purple Sandpiper*).

- TRINGA MARITIMA.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 382. *Cuv: Règ. Anim.*—vol. i., p. 525.
Sab: Trans. Linn. Soc.—vol. xii., p. 532. *Temm.*—vol. ii., p. 619.
Sab: Supp. to Parry's 1st Voy.—p. cci. *Rich: App. to Parry's 2d Voy.*—p. 354.
 STRIATED SANDPIPER.—*Arct. Zool.*—vol. ii., p. 472. *Lath: Syn.*—vol. v., p. 176.

But few individuals of this species were seen near our watering stations; we found them, however, in considerable numbers near Fury Point; and at Melville Island, on a former voyage, they were very numerous.

18.—TRINGA ALPINA (*American Dunlin*).

- TRINGA ALPINA.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 383.
Sab: Trans. Linn. Soc.—vol. xii., p. 533.
 TRINGA VARIABILIS.—*Fabian: Pinn. de l'Arctique*—p. 686. *Temm.*—vol. ii., p. 612.
Sab: Supp. to Parry's 1st Voyage—p. cc.
Rich: App. to Parry's 2d Voyage—p. 353.
Arct. Zool.—vol. ii., p. 476.

Is very abundant during the summer season near Felix Harbour, building its nest in the marshes and by the shoal lakes.

19.—PHALAROPUS FULICARIUS (*Flat-billed Phalarope*).

- PHALAROPUS FULICARIUS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 407.
 PHALAROPUS PLATYRHYNCHUS.—*Cuv: Règ. Anim.*—vol. i., p. 528. *Temm.*—vol. ii., p. 712.
Sabine, Trans. Linn. Soc.—vol. xii., p. 536.
Sab: Supp. to Parry's 1st Voyage—p. cci.
Rich: App. to Parry's 2d Voyage—p. 355
Ross, App. to Parry's 3d Voyage—p. 102.

Temminck's and Sabine's descriptions are excellent. Dr. Richardson's is taken from an individual killed in the Columbia River, and is of unusually small dimensions: of

above twenty measured by me, the smallest exceeded 8 inches in length, and the average of that number was rather more than $8\frac{1}{2}$ inches; he states the extreme length of his specimen to be only 7 inches. The females are larger than the males. Twelve of them together weighed 21 ounces, or $1\frac{1}{2}$ ounces each.

20.—STERNA ARCTICA (*Arctic Tern*).

STERNA ARCTICA.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 414. *Temm.*—vol. ii., p. 742.

Saline, Franklin's Journey—p. 694. *Sab: Supp. to Parry's 1st Voy.*—p. ccii.

Rich: App. to Parry's 2d Voyage—p. 356.

Ross, App. to Parry's 3d Voyage—p. 103; and *App. to Parry's Polar Voyage*—p. 194.

Very scarce, both to the east and west of the Peninsula of Boothia, only five or six having been seen by us during the three years we were in that neighbourhood.

It has lately been found abundantly on the west coast of Ireland, in the winter season.

21.—LARUS GLAUCUS (*Glaucous Gull*).

LARUS GLAUCUS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 417.

Cuv: Règ. Anim.—vol. i., p. 556. *Temm.*—vol. ii., p. 757.

Sab: Trans. Linn. Soc.—vol. xii., p. 543.

Sab: App. to Parry's 1st Voyage—p. cciii.

Ross, App. to Parry's 3d Voyage—p. 103.

GLAUCOUS GULL.—*Arct. Zool.*—vol. ii., p. 532. *Lath: Syn.*—vol. vi., p. 374.

Numbers of this magnificent species of Gull built their nests on the upper part of the face of a high precipice, two or three miles to the south of Felix Harbour; and the whole line of precipitous rock that forms the western shore of Prince Regent's Inlet, is annually resorted to by them in the breeding season. Although feeding chiefly on

fish, the young bird is scarcely inferior either in delicacy of flavour or colour to the tenderest chicken: the old ones, however, are not quite so palatable, and smell most offensively after being kept a day or two.

22.—*LARUS ARGENTATUS* (*Black-winged Silvery Gull*).

LARUS ARGENTATUS.—*Gmel.*—vol. i., p. 600. *Temm.*—vol. ii., p. 764.

Rich: App. to Parry's 2d Voyage—p. 358.

Ross, App. to Parry's 3d Voyage—p. 104.

SILVERY GULL.—*Arct. Zool.*—vol. ii., p. 533. *Lath: Syn.*—vol. vi., p. 375.

HERRING GULL.—*Arct. Zool.*—vol. ii., p. 527.

The individuals of this species obtained during our late voyage, agreed sufficiently with the descriptions above referred to, except perhaps that the markings on the primary quill feathers are not quite so dark as in European specimens.

Dr. Richardson has referred the examples of this bird, brought to England on our former voyages from Melville Island and Melville Peninsula, to the *Larus Argentatoides* of the Prince of Musignano. (*Faun: Bor. Amer.*—p. 417.)

23.—*LARUS LEUCOPTERUS* (*White-winged Silvery Gull*).

LARUS LEUCOPTERUS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 418.

LARUS ARGENTATUS.—*Sab: Trans. Linn. Soc.*—vol. xii., p. 546.

LARUS ARCTICUS.—*M. Gillivray, W. Ver. Trans.*—vol. v., p. 268.

This bird abounds in Greenland and Iceland, and was first described many years ago by Dr. Edmonstone, of Shetland, in the *Wernerian Transactions*, under the name of the “Less Iceland Gull,” from its general resemblance, except in size, to the *L. Glaucus*, which he had before described under the name of Iceland Gull. Captain Sabine, in his “*Memoir on the Birds of Greenland*,” *loc. cit.*, was disposed to have

considered this a new and undescribed species; but in deference to Mr. Temminck, who conceived that the absence of the dark markings on the wings might be occasioned by the severity of the climate in which it was found, he classed it with the preceding species. Its distinctive characters are now, however, sufficiently well known: the specimens obtained by us during our late voyage, agreed most exactly with Captain Sabine's description above referred to.

It was found breeding on the face of the same precipice with the Glaucous, but at a much less height, and in greater numbers.

It is not unfrequently met with at the Shetland Islands in the winter season, and may therefore be added to our catalogue of British Birds.

24.—LARUS EBURNEUS (*Ivory Gull*).

LARUS EBURNEUS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 419.

Phipps's Voyage, App.—p. 187. *Gmel.*—vol. i., p. 596.

Lath: Ind. Orn.—vol. ii., p. 816. *Temm.*—vol. ii., p. 769.

Sab: in Trans. Linn. Soc.—vol. xii., p. 543.

Supp. to Parry's 1st Voyage—p. cciv.

LARUS CANDIDUS.—*Fab: Faun. Grænl.*—p. 103, No. 67.

IVORY GULL.—*Penn: Arct. Zool.*—vol. ii., p. 529.

Although extremely numerous in Baffin's Bay, and frequently met with during our former voyages in the vicinity of Port Bowen, one of its breeding-places, yet few were seen by us after passing to the southward of that part of Prince Regent's Inlet; and only one specimen was obtained.

This beautiful species of Gull has lately visited the western shores of Ireland.

25.—LARUS TRIDACTYLUS (*Kittiwake*).

LARUS TRIDACTYLUS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 423. *Temm.*—vol. ii., p. 774.

Fab: Faun. Grænl.—p. 98. *Lath: Ind. Orn.*—vol. ii., p. 817.

Sab: Supp. to Parry's 1st Voyage—p. ccv.

Rich: App. to Parry's 2d Voyage—p. 359.

Ross, in App. to Parry's 3d Voy.—p. 105; and *Polar Journey*—p. 195.

KITTIWAKE.—*Penn: Arct. Zool.*—vol. ii., p. 529. *Brit. Zool.*—vol. ii., p. 186.

Lath: Syn.—vol. vi., p. 393.

27.—*LARUS SABINI* (*Fork-tailed Gull*).

LARUS SABINI.—Rich : *Faun. Bor. Amer.*—vol. ii., p. 423.

Sabine (Mr.), *Trans. Linn. Soc.*—vol. xii., p. 520, pl. 29 (very good).

Sabine (Capt.), *Trans. Linn. Soc.*—vol. xii., p. 551; and *Supp. to Parry's 1st Voyage*—p. ccv.

Rich : *App. to Parry's 2d Voyage*—p. 360.

Ross, App. to Parry's Polar Voyage—p. 195.

XEMA COLLARIS.—*Leach, in Ross's Voyage*, oct. edit.—vol. ii., p. 164.

Was discovered by Captain Sabine on the three islands of Bassin, during Captain Ross's first voyage to these regions in 1818, and described by Mr. Sabine with minute accuracy in the Transactions of the Linnæan Society, *loc. cit.*

Since that period it has been found in many parts of the Arctic Regions; at Spitzbergen, Igloolik, and Behring's Straits; and by our party as we travelled along the coast, a little to the southward of Cape Garry. I have no doubt that the low land where it was met with, is one of its breeding-places.

I have lately heard that it has also been found on the west coast of Ireland, so that it has a much more extensive range than was at first supposed; and it is the more extraordinary that it remained so long unknown to naturalists.

Only one specimen was obtained by us at Felix Harbour; it was shot by Dr. McDiarmid, and was the only one seen during our three years' residence in that quarter. The Esquimaux informed me that it breeds in great numbers on the low land west of Neityelle.

Dr. Leach founds its generic distinction on the forecure of the tail: for a similar reason the *L. Rossii* should also form the type of a new genus, no other known Gull having a cuneiform tail.

28.—*LESTRIS POMARINUS* (*Pomarine Jaeger*).

LESTRIS POMARINUS.—Rich : *Faun. Bor. Amer.*—vol. ii., p. 427. *Temm.* vol. ii., p. 793.

Sab : *Supp. to Parry's 1st Voyage*—p. ccvi. *Rich* : *App. to Parry's 2d Voyage*—p. 361.*

Ross, App. to Parry's 2d Voyage—p. 105; and *Parry's Polar Voyage*—p. 196.

Is a larger bird and much more scarce than the common Arctic Jaeger. It varies

very much in colour, according to age, some being entirely of a uniform blackish-brown, and others more or less marked with lighter colours.

A nest with two eggs was found near Fury Point, by the margin of a small lake.

29.—LESTRIS PARASITICUS (*Arctic Jaeger*).

LESTRIS PARASITICUS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 430. *Temm.*—vol. ii., p. 796.

Sub : Trans. Linn. Soc.—vol. xii., p. 551. *Supp. to Parry's 1st Voyage*—p. ccvi.

Rich : App. to Parry's 2d Voyage—p. 361. *Ross, App. to Parry's 3d Voyage*—p. 105; and *App. to Parry's Polar Voyage*—p. 196.

CATHARACTA PARASITICA.—*Fab : Faun. Græul*—p. 103.

The form and relative length of the central tail feathers of this bird vary so much according to age and other circumstances, as to have induced the belief of the existence of several distinct, but very nearly allied, species, and the differences observed in the plumage of the immature birds, materially tended to strengthen this idea. Temminck and Sabine were the first to point out the mistakes that preceding authors had made, and by giving accurate descriptions of the bird in every state of plumage from the egg to maturity, have prevented a recurrence of similar errors.

30.—PROCELLARIA GLACIALIS (*Fulmer Petrel*).

PROCELLARIA GLACIALIS.—*Temm.*—vol. ii., p. 802. *Lath : Ind. Orn.*—vol. ii., p. 823.

Fab : Faun. Græul—p. 86. *Gmel.* vol. i., p. 562. *Sub : Supp. to Parry's 1st Voyage*—p. ccvi. *Ross, App. to Parry's 3d Voyage*—p. 106; and *App. to Parry's Polar Voyage*—p. 196.

FULMER PETREL.—*Lath : Syn.*—vol. iv., p. 403. *Penn : Arct. Zool.*—vol. ii., p. 534. *Brit. Zool.*—vol. ii., p. 203.

Abounds in most parts of the North Atlantic Ocean, but is peculiarly numerous in Hudson's Bay, Davis's Strait, and Baffin's Bay. It is also occasionally met with to the

westward of Lancaster Sound, and in Regent's Inlet, following the whale ships, and availing themselves of the success of the fishermen, by feeding off the carcass of the whale after it has been deprived of its blubber and turned adrift. It is often of essential service to those employed in the capture of the whale, by guiding them to those places where the fish are most numerous, and by giving notice of the first appearance of those animals at the surface of the water, by crowding to the spot from all quarters.

31.—SOMATERIA SPECTABILIS (*King Duck*).

SOMATERIA SPECTABILIS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 447.

ANAS SPECTABILIS.—*Temm.*—vol. ii., p. 851. *Gmel.*—vol. i., p. 507. *Lath : Ind. Orn.*—vol. ii., p. 845.

Fab : Faun. Græc.—p. 63. *Sab : in Trans. Linn. Soc.*—vol. xii., p. 553.

Sab : Supp. to Parry's 1st Voyage—p. ccvii. *Rich : App. to Parry's 2d*

Voyage—p. 371. *Ross, App. to Parry's 3d Voyage*—p. 106.

KING DUCK.—*Penn. Brit. Zool.*—vol. ii., p. 246. *Arct. Zool.*—vol. ii., p. 554. *Lath : Syn.*—vol. vi., p. 473.

Vast numbers of this beautiful duck resort annually to the shores and islands of the Arctic Regions in the breeding season, and have on many occasions afforded a valuable and salutary supply of fresh provision to the crews of the vessels employed on those seas. On our late voyage, comparatively few were obtained, although seen in very great numbers. They do not retire far to the south during the winter, but assemble in large flocks; the males by themselves, and the females with their young brood, are often met with in the Atlantic Ocean, far distant from any land, where the numerous crustaceous and other marine animals afford them abundance of food.

32.—SOMATERIA MOLLISSIMA (*Eider Duck*).

SOMATERIA MOLLISSIMA.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 44.

ANAS MOLLISSIMA.—*Temm.*—vol. ii., p. 848. *Gmel.*—vol. i., p. 514. *Lath : Ind. Orn.*—vol. ii., p. 845.

Fab : Faun. Græc.—p. 68. *Sab : Supp. to Parry's 1st Voyage*—p. ccviii.

Rich : App. to Parry's 2d Voyage—p. 370. *Ross, App. to Parry's 3d Voyage*—p. 106; and *Polar Voyage*—p. 197.

EIDER DUCK.—*Penn. Brit. Zool.*—vol. ii., p. 243. *Arct. Zool.*—vol. ii., p. 553.

Lath : Syn.—vol. vi., p. 479.

Is so similar in its habits to the preceding species, that the same remarks equally apply to both. This is, however, more generally known as a European bird, and is famous for the beautifully elastic down from which it receives its name. That of the *S. Spectabilis* is equally excellent, and is collected in great quantities by the inhabitants of the Danish colonies in Greenland, and forms a valuable source of revenue to Denmark. Vast quantities of this down is also collected on the coast of Norway, and in some parts of Sweden.

33.—*HERALDA GLACIALIS* (*Long-tailed Duck*).

HERALDA GLACIALIS.—*Rich*: *Faun. Bor. Amer.*—vol. ii., p. 460.

ANAS GLACIALIS.—*Temm.*—vol. ii., p. 860. *Gmel.*—vol. i., p. 529. *Lath*: *Ind. Orn.*—vol. ii., p. 864.

Sab: *Trans. Linn. Soc.*—vol. xii., p. 555. *App. to Parry's 1st Voyage*—p. ccviii.

Rich: *App. to Parry's 2d Voyage*—p. 373.

ANAS HIEMALIS.—*Fab*: *Faun. Grænl.*—p. 71.

LONG-TAILED DUCK.—*Penn. Brit. Zool.*—vol. ii., p. 268. *Arct. Zool.*—vol. ii., p. 566.

Lath: *Syn.*—vol. vi., p. 468.

The most noisy and most numerous of the ducks that visit the shores of Boothia. Being a quicker diver, and of more rapid and irregular flight, fewer of this species than of the other were shot. Its down is equally valuable with that of the two preceding species, but is of a darker colour. Its flesh is most excellent food.

The peculiar structure of the trachea of this and the two preceding birds, are described and figured by Captain Sabine, *loc. cit.*

34.—*ANSER BERNICLA* (*Brent Goose*).

ANSER BERNICLA.—*Rich*: *Faun. Bor. Amer.*—vol. ii., p. 469.

ANAS BERNICLA.—*Temm.*—vol. ii., p. 825. *Gmel.*—vol. i., p. 513. *Lath*: *Ind. Orn.*—vol. ii., p. 844.

Fab: *Faun. Grænl.*—p. 41. *Sab*: in *Franklin's Journey*—p. 698. *Sab*: *Supp.*

to *Parry's 1st Voyage*—p. 207. *Rich*: in *App. to Parry's 2d Voyage*—p. 367.

Ross, Parry's Polar Voyage—p. 196.

BRENT GOOSE.—*Penn. Brit. Zool.*—vol. ii., p. 151. *Arct. Zool.*—vol. ii., p. 551.

Lath: *Syn.*—vol. vi., p. 467.

This well-known winter inhabitant of the lochs and friths of the Scottish coast, is found during the summer months in the highest northern latitude that has yet been reached, but in no great numbers. It did not remain in the neighbourhood of Felix Harbour to breed, but several large flocks were seen on their way to the northward, of which only a few were shot. We found them in greater numbers near Fury Point, and along the low line of coast to the southward, which, abounding with extensive fresh-water lakes, is probably one of their breeding stations.

35.—ANSER HUTCHINSII (*The Less Canada Goose*).

ANSER HUTCHINSII.—*Rich : Faun. Bor. Amer.*—vol. II., p. 470.

ANAS BERNICLA, β .—*Rich : App. to Parry's 2d Voyage*—p. 368

These birds arrived in flocks about the middle of June, in the neighbourhood of Felix Harbour, and soon after dispersed in pairs to their breeding places. At Igloodik, the only place where we had before met with them, their nests were found in the marshes near the sea; but on this occasion several pairs constructed their nests on a ledge of rock near the foot of a high precipice: immediately above them the dovesies, looms, several species of gulls, and near its summit the jerfalcon and raven built their nests.

From three to four eggs were found in each nest, of a pure white, and of an oval form, measuring 3.1 inches by 2.1, and weighing from 1800 to 2000 grains.

The female bird is smaller than the male; to the measurements given by Dr. Richardson, which are very accurate, we may add that its extent of wing is fifty-two inches, and that it averages about four pounds and a half in weight.

Its flesh is of a most exquisite flavour.

36.—COLYMBUS GLACIALIS (*Great Northern Diver*).COLYMBUS GLACIALIS.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 474.*Tenn.*—vol. ii., p. 910. *Fab : Faun. Græn.*—p. 97.*Sab : Franklin's Journey*—p. 703.NORTHERN DIVER.—*Penn : Brit. Zool.*—vol. ii., pp. 165, 167, pl. 30. *Arct. Zool.*—vol. ii., p. 518;

Only three specimens of this magnificent bird were obtained, and in each of these a most striking difference was observed in the colour of the bill, from the usual descriptions of authors. In our specimens the bill being of a very light horn colour, whilst in the European bird it is described as being black. There are other differences in the relative measurements of our bird, which will be more manifest by comparing the dimensions given by Dr. Richardson, *loc. cit.*, with the mean of the measurements of our three specimens.

Extreme length	. 36 inches.	Mean of our specimens	31.4 inches
Tail	. . . 4	2.7
Bill above	. 3.1	3.65
to rictus	. 4.6	5.42
Tarsus	. . 4.4	4.2
Extent of wing	48	58
Weight	10 pounds.	

Thus it appears that our bird, though four inches and a half shorter, has a bill eight-tenths of an inch longer, and ten inches greater extent of wing than that described by Dr. Richardson. I should have been disposed to agree with Wilson in supposing that there are two species, and have assigned to the Boothian Divers a new specific name; but on communicating with my friend Joseph Sabine, Esq., whose ornithological experience is only exceeded by the ready assistance he affords to whoever may wish to avail themselves of his high authority, I am now induced to concur with him in the belief that the lighter colour of the bill may be occasioned by age, more especially as no difference of any importance could be detected in the colours of the plumage.

37.—COLYMBUS ARCTICUS (*Black-throated Diver*).COLYMBUS ARCTICUS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 475.*Temm.*—vol. ii., p. 913. *Rich: App. to Parry's 2d Voyage*—p. 376.BLACK-THROATED DIVER.—*Penn: Arct. Zool.*—vol. ii., p. 520.

This beautiful species of Diver was but rarely met with by us, and only two specimens were obtained.

It is found abundantly in Greenland, which seems to be its chief breeding place. The natives make an inner dress of the richly-coloured velvet-like plumage of the throat of this and the following species, which being worn next to the skin, is the warmest and most luxurious dress that can be made.

38.—COLYMBUS SEPTENTRIONALIS (*Red-throated Diver*).COLYMBUS SEPTENTRIONALIS.—*Rich: Faun. Bor. Amer.*—vol. ii., p. 475. *Temm.*—vol. ii., p. 916.*Gmel.*—vol. i., p. 586. *Lath: Ind. Orn.*—vol. ii., p. 801.*Sab: Faun. Grænl.*—p. 94. *Sab: Trans. Linn. Soc.*—vol. xii.,• p. 542. *Supp. to Parry's 1st Voyage*—p. ccix. *Rich:**App. to Parry's 2d Voyage*—p. 337. *Ross, App. to Parry's**3d Voyage*—p. 106; and *Parry's Polar Voyage*—p. 197.RED-THROATED DIVER.—*Penn: Brit. Zool.*—vol. ii., p. 169. *Arct. Zool.*—vol. ii., p. 520.*Lath: Syn.*—vol. vi., p. 344.

Much more abundant in Boothia than either of the two preceding species, and has been found in every part of the Arctic Regions visited by the late expeditions.

39.—URIA BRUNNICHII (*Brunnich's Guillemot*).

URIA BRUNNICHII.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 477. *Temm.*—vol. ii., p. 924.

Sab : Trans. Linn. Soc.—vol. xii., p. 538. *Supp. to Parry's 1st Voy.*—p. ccix.

Rich : App. to Parry's 2d Voy.—p. 377. *Ross, App. to Parry's 3d Voy.*—p. 106; and *Parry's Polar Voyage*—p. 197.

Captain Sabine, in his valuable memoir on the birds of Greenland, was the first to point out the mistaken notions of preceding authors with respect to this bird, and to rescue it from the confusion into which wrong synonyms and imperfect descriptions had involved it; and in distinguishing it by the name of Brunnich, paid a well-merited tribute to the indefatigable research and accuracy in observation of that learned naturalist.

It abounds in Baffin's Bay, and is found in most parts of the Arctic Seas. I have also met with it at Unst, the northernmost of the Shetland Islands, and in several parts of Scotland; but it has ever been confounded by authors, with the *Uria Troille*, which it so nearly resembles.

Captain Sabine and Brunnich* have clearly marked the distinctive specific characters of this species.

40.—URIA GRYLLE (*Black Guillemot*).

URIA GRYLLE.—*Rich : Faun. Bor. Amer.*—vol. ii., p. 478. *Temm.*—vol. ii., p. 925.

Fab : Faun. Grænl.—p. 92. *Sab : Trans. Linn. Soc.*—vol. xii., p. 540.

Sab : Supp. to Parry's 1st Voy.—p. ccix. *Rich : App. to Parry's 2d Voy.*—p. 377.

Ross, App. to Parry's 3d Voyage—p. 107; and *Polar Voyage*—p. 197.

BLACK GUILLEMOT.—*Penn : Brit. Zool.*—vol. ii., p. 163. *Arct. Zool.*—vol. ii., p. 516.

This well-known beautiful little bird is found during the summer months in all parts of the Arctic Seas, and is the only water-fowl that remains in very high northern latitudes throughout the winter.

* *Brunnichii Ornithologia Borealis (Uria Troille)*, No. 109.

Dr. Richardson has already described its plumage, during that season of the year, with minute accuracy, from some specimens that were shot by me near Igloolik, in March, 1823. One individual only was obtained by us during the winter, although several others were seen off Fury Point, in February, 1833.

It was subsequently met with in great numbers as we travelled along the high precipitous land between Fury Point and Batty Bay, where they collected in vast quantities during the breeding season, affording to our party many delicious meals, and proving a valuable addition to our then scanty stock of provision. Several thousands were shot by our sportsmen, and by means of this providential supply of fresh food, several of the men, that had been long afflicted with that most dreadful malady, the sea scurvy, were restored to health.

It is not equal in flavour to the preceding species, but is much more numerous and more extensively dispersed along the coasts of the Arctic Seas.

1.—CYCLOPTERUS MINUTUS.

CYCLOPTERUS MINUTUS.—*Pallas, Spicil. Zool.*—vol. vii., p. 12, pl. 3, figs. 7—9.

Fab : Faun. Grænl.—p. 135.

Pallas's description of this extraordinary and beautiful little fish is most perfect. It is the *Cycloptère Menu* of Lacepède,* the *Bouclier Menu* of Bonnaterre,† and probably the small species of this genus, alluded to by Mr. Couch, in his paper on the "Natural History of Fishes found in Cornwall," published in the fourteenth volume of the Transactions of the Linnæan Society, p. 87.

It is found in many parts of the Atlantic Ocean; Fabricius observed it in the southern parts of Greenland, and great numbers were taken by us from amongst the extensive floating patches of seaweed that are met with off that coast; but it has never been seen at any great distance to the northward of the Arctic circle.

It rarely much exceeds an inch in length, and is therefore not used by the natives of Greenland as food, but constitutes the chief means of subsistence to the several species of gulls which are seen hovering over those banks of seaweed in astonishing numbers.

Bloch.—pl. 123, fig. 3. *Ross, App. to Parry's Polar Voy.*—p. 199.

CYCLOPTERUS GELATINOSUS ?—*Pallas, Spicil. Zool.*—vol. vii., p. 21, pl. 3, fig. 1.

Was found in company with the preceding, but less numerous ; it extends its range to the highest northern latitudes, having been found at Spitzbergen, Melville Island, Kamschatka, and in almost every part of the Arctic Seas that has been visited by the late Expeditions of Discovery.

Several specimens were obtained by us near Felix Harbour, all of which belong to the first variety of this species, noticed by Otho Fabricius, *loc. cit.*, and may eventually prove to be a distinct species, although the descriptions of authors and figures quoted may equally apply to both varieties, except in the size, and in the absence of the two cirrhi in the upper lip, which are wanting in the individual under consideration.

The average length of our variety, from the tip of the snout to the insertion of the tail, is somewhat more than three inches, whilst that of the larger variety, mentioned by Fabricius, is often a foot, and by other authors said to attain sixteen to eighteen inches.

The sucking apparatus consists of thirteen tubercles, arranged in a circular form, about one-third of an inch in diameter, and placed exactly between the snout and the vent.

3.—OPHIDIUM PARRII.

OPHIDIUM PARRII.—*Ross, App. to Parry's 3d Voyage*—p. 109.

Ross, App. to Parry's Polar Voyage—p. 199.

This species, which was discovered several years ago in Prince Regent's Inlet, during Sir Edward Parry's third voyage to the Arctic Seas, belongs to

Cuvier,* subgenus *Les Fierasfers*, and for the same reason to the second subgenus of Lacepède,† distinguished by the absence of “*barbillons aux mâchoires*.”

A single individual of this very rare species, not exceeding four inches in length, was ejected from the stomach of a glaucous gull, shot by us near Felix Harbour. It agreed sufficiently well with the description above quoted.

4.—OPHIDIUM VIRIDE.

OPHIDIUM VIRIDE.—*Fab: Faun. Grænl.*—p. 141.

Ross, App. to Parry's 3d Voyage—p. 110.

OPHIDIUM UNERNAK.—*Lacepède, Hist. Nat. des Poissons*—vol. ii., p. 282.

Like the preceding species, was but rarely met with by us; a few individuals were obtained from among the patches of seaweed off the west coast of Greenland, in July, 1829, agreeing very exactly with the excellent description of Otho Fabricius, *loc. cit.*

5.—GADUS MORHUA (*Common Codfish*).

GADUS MORHUA.—*Cuv: Reg. Anim.*—vol. ii., p. 330. *Titte de la Morue*—pl. 10.

Lacepède, Hist. Nat. des Poissons—vol. ii., p. 369, pl. 10, fig. 1.

O-wuk.—Esquimaux of Boothia.

Beached off the west coast of Greenland, in latitude $66\frac{1}{2}^{\circ}$ N, a number of very fine codfish were caught by our crew. The bank on which they were found, consists of coarse sand, broken shells, and small stones, with from eighteen to thirty fathoms water over it.

* Règne Animal—vol. ii., p. 359.

† Histoire Naturelle des Poissons—vol. ii., p. 278.

There are several other banks of considerable extent along that coast, where the cod-fish assemble in the autumn in astonishing numbers ; and although so near to some of the Danish colonies, but little advantage is derived from those fisheries, which if properly managed would doubtless prove of very great benefit to the inhabitants of that part of the country, as an article of food, and of considerable value to Denmark in a commercial point of view.

We observed much difference in the number of the rays of the dorsal fins, from those given by Lacepède. In all those examined by me, without a single exception, the second back fin contained a greater number of rays than either the first or third ; although there was considerable variation in those of some individuals.

The following dimensions are taken from an average of fifteen different fishes, varying in length from twenty-nine to forty-six inches, and in weight from eight to thirty-five pounds :

Length from the tip of the snout to the end of the tail . . .	36.7 inches
of the head to the posterior part of the gill covers . . .	9.1
of the tail (from its insertion)	5.2
Depth of the tail	7.4
Average weight, 16 lb. 2 oz.	

B 7. P 18. V 6. A 19, 20. D 14, 20, 17. C 38 to 40.

This fish had never before been found during any of the preceding Arctic expeditions, although frequently sought for ; but on our late voyage we purchased a number of a smaller size, much resembling in colour the rock codling of our coast, from a party of Esquimaux, who were fishing for them through holes in the ice, that covered the inlet on the west side of the peninsula of Boothia, near Cape Isabella, in June, 1831. Those obtained from the natives varied from fourteen to twenty-five inches in length, but we were told by them that those taken in the autumn at a short distance to the westward often exceeded three feet.

The alimentary canal of the largest examined by me rather exceeded twice the length of the body, and was furnished with two hundred and fifty simple cylindrical cæca.

NATURAL HISTORY.

6.—GADUS CALLARIAS.

GADUS CALLARIAS.—*Lacépède, Hist. Nat. des Poissons*—vol. ii., p. 409.

Cuv : Règ. Anim.—vol. ii., p. 332.

Fab : Faun. Grænl.—p. 144.

Il-lit-toke.—Esquimaux of Boothia.

This species of codfish is found abundantly in the Baltic, the White Sea, and along the whole of the continental coast line of the north of Europe. Fabricius describes it as being very numerous in many parts of Greenland; and our having found it on the north coast of the American continent, along the shores of the inlet to the west of the peninsula of Boothia, is an interesting feature in its history. At the same time, the fact that the only four species of fish which were found by us in that inlet, being also common to Davis's Strait and Baffin's Bay, may be considered an additional proof (if any be still wanting) of a water communication between these two seas. It is also worthy of remark, that only two of these four species inhabit the sea on the east side of the isthmus of Boothia.

From the middle of May until near the end of June the seal-fishery is very unproductive, and attended with great labour and difficulty; the salmon do not arrive until the rivers begin to pour their waters into the sea; and during the interval, the Esquimaux assemble along the shores of that inlet, and procure a sure and abundant supply of this fish. At that period of the year it is in very poor condition, and nothing but absolute necessity could induce the natives to seek a kind of food which they dislike so much. Our party had been on very short allowance of provisions previous to meeting the Esquimaux who were engaged in its capture, and this providential supply of provisions was of essential benefit to us, and we all thought it excellent food.

It is not improbable that the three specimens of a species of *Merlangus?* mentioned by Captain Sabine,* as having been found frozen in the ice that covered Winter Harbour, in Melville Island, belongs to this species, although from the mutilated state of the specimens, he was unable to determine their identity. The number of fin rays given by him agree very nearly with the average of a number examined by me. It seldom much

* Supp. to Parry's 1st Voyage—p. ccxii.

exceeds fourteen inches in length, but some specimens were obtained nearly a foot and a half long, from which the following dimensions are given :

Length from the tip of the snout to the end of the tail	17.3 inches
of the head to the posterior part of the gill covers	4.5
of the tail (centre rays)	1.2
from the tip of the snout to the vent	8.6

Fin Rays: B 7. P 19. V 6. A 22, 22. D 12, 19, 23. C 40 to 44.

Alimentary canal, fourteen inches. Cæcal appendages forty-two, varying from an inch and a half to half an inch in length. Cirrus on the lower jaw 0.7 of an inch long.

7.—MERLANGUS POLARIS.

MERLANGUS POLARIS.—*Sub: Supp. to Parry's 1st Voyage*—p. ccxi.

Ross, App. to Parry's Polar Voyage—p. 199.

This little fish inhabits the northern seas as far as we have hitherto been able to penetrate towards the pole; having been found in lat. $82\frac{3}{4}^{\circ}$ N, swimming near the surface of the sea, amongst the broken fragments of ice, and affording to the gulls and other seafowl their chief source of subsistence.

During our late voyage we found them wherever we went; great numbers were taken by us from between the cracks in the ice, which covered the harbour of Batty Bay, in July, 1833, and contributed greatly to support the strength of our party, when on a very small allowance of provisions.

At that period of the year it is much infested with the *Lernæa gadina*, which attaches itself to the gills of the fish.

It does not quit the Arctic Seas during the winter, several having been taken in a net at Felix Harbour during that season.

It seldom exceeds ten inches in length.

8.—BLENNIUS POLARIS.

BLENNIUS POLARIS.—*Sab: Supp. to Parry's 1st Voyage*—p. cexii.

Ross, App. to Parry's Polar Voyage—p. 200.

B. unberbis, pinnis anali, caudali, dorsalique, unitis. (Sabine.)

Like the *Merlangus Polaris*, it well deserves the specific name bestowed on it by Captain Sabine, from its having been found in the highest northern latitudes. It is, however, by no means numerous, and only one specimen was obtained during our late voyage; it was taken from the stomach of a *Gadus Callarias*, that was caught in the inlet on the west side of the peninsula of Boothia, and agreed, so far as its mutilated state would admit of comparison, with Captain Sabine's description, *loc. cit.*

9.—COTTUS QUADRICORNIS.

COTTUS QUADRICORNIS.—*Lacepède, Hist. Nat. des Poissons*—vol. iii., p. 241.

Sab: Supp. to Parry's 1st Voyage—p. cexiii.

Ross, App. to Parry's 3d Voyage—p. 111.

Bloch, Ich.—vol. iii., p. 146, pl. 108.

COTTUS SCORPOIDES.—*Fab: Faun. Grand.*—p. 157.

Kan-ny-yoke.—Esquimaux of Boothia.

Is abundant along the west coast of Greenland, but is more rarely met with in the higher northern latitudes. Two or three individuals were taken in a net in Felix Harbour, and several were captured by the natives on the west side of the peninsula of Boothia, differing in no respect from the excellent description and plate in the Ichthyology of Bloch.

Fabricius observes of the *Cottus Scorpius*, that although in daily use, it is the favourite food of the Greenlanders, and is considered wholesome for the sick; and of the *Cottus Scorpoides*, that it is less savoury; the natives of Boothia, however, prize it very highly, preferring it to the codfish or salmon.

It is also worthy of remark, that the Esquimaux of Boothia apply the same name to this fish that the Greenlanders do to the *C. Scorpius* of Fabricius.

10.—COTTUS POLARIS.

COTTUS POLARIS.—*Sab : Supp. to Parry's 1st Voyage*—p. ccxiii.

C. imberbis, capite spinis duabus, operculis spinis quatuor, armatis. (Sabine.)

This species of Cottus was found abundantly in pools of water, left by the falling of the tide, near the mouths of rivers, or streams of fresh water, on the east side of the isthmus of Boothia, and particularly so along the low shores of Sheriff Harbour. Those examined by me agreed very nearly with Captain Sabine's description, excepting, only, some slight difference in the number of the fin rays, which from the average of a great many noted by me, but varying considerably with each other, I found to be as follows :

P 15. V 5. A 15. D 8, 13. C 12 to 14.

It seldom exceeds two inches in length, and from its numbers, affords a supply of food to the gulls, ducks, and other waterfowl that resort to those regions to breed.

11.—PLEURONECTES HIPPOGLOSSUS.

PLEURONECTES HIPPOGLOSSUS.—*Lacépède, Hist. Nat. des Poissons*—vol. iv., p. 601.

Cur : Règ. Anim.—vol. ii., p. 340.

Fab : Faun. Græc.—p. 161.

PLEURONECTE FLÉTAN.—*Bloch, Ich.*—pl. 47.

HALIBUT.—*Penn. Brit. Zool.*—vol. iii., p. 184. ;

The common Halibut of our shores is found abundantly near the west coast of Greenland, but it seldom attains to a very great size. The largest seen by O. Fabricius did not much exceed four feet in length : those taken by us varied in this from thirty-eight to forty-four inches ; and in weight from twenty-two

to forty-one pounds. According to Laccépède, it has been captured near the coasts of Iceland and Norway, of a most enormous magnitude, rivalling in size some of the smaller species of the whale kind; and Pennant, who had himself seen one that weighed three hundred pounds, says, that much larger ones are frequently taken near Iceland. The following dimensions are the average of ten, that we took off the west coast of Greenland, in July, 1829, from the same bank as the *Gadus Morhua* of this notice.

Length from the tip of the snout to the end of the tail	. 43.1 inches
of the head to the posterior part of the gill covers	10.7
of the tail (centre ray) 6.0
of the rays of the anal and dorsal fins 4.3
Breadth of the tail 13.3
of the body 21.1
Average weight, 34 $\frac{1}{2}$ lb.	

Number of fin rays: B 7. P $\frac{14}{6}$. V 6. D 99. A 77. C 17.

SALMONES,

BY JOHN RICHARDSON, M.D., F.R.S., &c.

The following notices of four specimens of *trout*, brought from Boothia Felix by CAPTAIN JAMES CLARK ROSS, are drawn up in very general terms, that they may not occupy more space than that assigned to the other objects of Natural History, described in the Appendix ; but figures, with the characters of the species in minute detail, will be given in the third volume of the "Fauna Boreali Americana," now preparing for publication.

The first species is, as far as we know, peculiar to the inlet in which it was found. It would have been highly interesting to have detected the same species of salmon in Coronation Gulf and Regent's Inlet, but the *Salmo Hearnii* and *Mackenzii*, and several species of *Coregonus*, found in the former, were not seen in the latter ; neither have the *S. salar*, or common salmon, which frequents the rivers from Labrador to the forty-second parallel of latitude, nor an undescribed species, resembling the *Gorbuscha* of Kamtschatka, which abounds in New Caledonia, been hitherto detected in the American Polar Seas ; nor does the *S. namaycush* (Pennant), a gigantic trout, which exists abundantly in all the great American lakes, appear to have been observed in the waters of Boothia Felix. The last species, however, that is mentioned in the following notices, is common in all parts of the fur countries ; and it is probable that *S. alipes* and *nitidus* have also an extensive range, though want of more southern specimens have prevented us from ascertaining the fact.

SALMO ROSSII (*Ross's Arctic Salmon*).

ICON.—*Faun. Bor. Amer.*—pl. 30, and the head pl. 85, fig. 2.

This salmon, named *Eekalook* by the Esquimaux, was found in vast numbers* in the sea near the mouths of rivers, and furnished an agreeable article of diet to the members of the Expedition. It is quite distinct from any species that we have had an opportunity of seeing in other parts of America, and it does not agree with the character of any of those described in the History of Kamtschatka, as quoted in "Arctic Zoology," except perhaps with the *Salmo malma* (Steller) or *Golet* of the Russians, which corresponds with it in its comparatively slender cylindrical form, small scales, scarlet spots on the sides, and the colours of some other parts. But the *Golet*, instead of being found only in the sea, ascends rivers to their very sources, and does not congregate in shoals like the *Salmo Rossii*. None of the Scandinavian salmon described by Nilsson have any resemblance to *S. Rossii*.

The most remarkable peculiarities of this species, are the truncated form of the upper jaw; the length of the lower one, which considerably exceeds the distance between the tip of the snout and nape of the neck; and the smallness and form of its scales. These are imbedded in a mucous skin, which entirely covers them, except their small truncated tips, that project and feel very rough to the touch in the dried specimen. The scales are rather remote, being nowhere tiled. The teeth in the jaws are remarkably obtuse. In addition to the row on each side of the tongue, which exists in all the other *Truttae*, there are two or more rows of smaller teeth, crowded across the tip of that organ. Two drawings by Captain Ross, with the inspection of the dried skin, enable us to describe the colours as follows:—Back, top of the head, dorsal and caudal fins intermediate between oil-green and hair-brown; sides pearl-grey and silvery, with a blush of lilac, marked near the lateral line with scattered round dots of carmine. The belly varies from tile-red to arterial blood-red; the sides of the head are nary. When the fish is out of season, the colour of the lower parts fades to a

* Some idea may be formed of the amazing numbers in which the *Salmo Rossii* visit the rivers of Boothia Felix, by mentioning that from a single haul of a small-sized seine net, we landed 3378 salmon, varying in weight from two to fourteen pounds, and averaging something more than four; the whole rather exceeded six tons weight. A great many more were enclosed in the net, but escaped through some holes that were for some time unobserved, and others by leaping over it.—J. C. Ross.

dusky-orange. The flesh is reddish, of different tints in different individuals, being best flavoured when the colour is most intense.

The length of the specimen which was brought home is thirty-four inches, of which the head forms one-fifth.

The following are the numbers of the rays of the fins :

Br. 12, 13. D 13—0. P 14. V 10. A 11. C 21 $\frac{6}{8}$.

SALMO ALIPES (*Long-finned Char*).

ICON.—*Faun. Bor. Amer.*—pl. 81, and the head pl. 86, fig. 1.

This species, which with several other kinds, is included by the Esquimaux under the general appellation of *Eekalook-peedeook*, was found in a small lake, whose waters were discharged into the sea by a rivulet about half a mile long. The smallness of its scales, and the vomerine teeth being confined to the anterior knob, characterize it as belonging to the subdivision *Salvelini* or Chars of Nilsson. Its form is slender, its jaws are of nearly equal length, and it differs from all its congeners, that we have seen, in the great comparative length of its fins. The scales are small and crowded, but not tiled ; they are covered with a thin epidermis, and do not exhibit the projecting naked tips, which give so peculiar a character to the skin of *Salmo Rossii*. Even in the dried specimen they are perfectly smooth to the touch. No description of the colours of this species was furnished to us, but as far as can be judged from the tints remaining in the prepared skin, the upper parts were hair-brown, the sides paler, with yellowish spots, and the belly white or yellow ; the under fins more or less deeply orange.

The length of the specimen is twenty-four inches, of which the head measures one-fifth.

Fins : Br. 11, 12. P 15. D 13—0. V 9. A 10 or 11. C 19 $\frac{6}{8}$.

SALMO NITIDUS (*The Angmalook*).

ICON.—*Faun. Bor. Amer.*—pl. 82, fig. 1, and head pl. 86, fig. 2.

This fish, which is also to be ranked among the Chars, was found in the same lake with the preceding one, to which it bears much resemblance in the form of the parts of

the head, and in the size and general character of the scales; it differs from it, however, in having a thicker body, a ventricose belly, and short fins. Its upper jaw, too, is comparatively shorter, the distance from the tip of the snout to the extremity of the labials, when applied to the top of the head, falling about an inch short of the nape instead of reaching to it as in the preceding species. Its colours are described as follows by Captain J. C. Ross: "The body above the lateral line is of a deep green, softening towards the belly, which, posteriorly to the pectorals, is of a beautiful yellowish-red. There are several rows of ocellate red spots, confined chiefly to the space between the lateral line and the yellowish-red of the belly, and varying in size, the largest being as big as a pea. The dorsal fins are of the colour of the back. The pectorals, ventrals, and anals, are dusky-red, their first rays white."

The length of the specimen is twenty inches, of which the head forms more than one-fifth.

Fins: Br. 11, 12. P 17. D 14—0. V 10. A 12. C $21\frac{1}{2}$.

SALMO HOODII (*The Masamacush*).

ICON.—*Faun. Bor. Amer.*—pl. 82, fig. 2, pl. 83, fig. 2, and head pl. 87, fig. 1.

This Char is well known throughout the fur countries, being found in every river and lake. Its Cree name is *Masâw-mæcoos*. It resembles the two preceding Chars in its scales, but differs from them in the shortness of its jaws, and from the rest of the genus in the peculiar smallness of its head, which forms only one-sixth of the total length. Plate 82, fig. 2, above quoted, is copied from a drawing made from a recent specimen taken at Cumberland House, on the Saskatchewan, lat. 54° , by the lamented officer whose name it bears; while plate 83, fig. 2, is from the dried skin brought home by Captain J. C. Ross. An individual killed at Fort Enterprise, in March, 1821, exhibited the following colours: Back and sides intermediate between olive-green and clove-brown, bestudded with moderately large roundish spots of yellowish-grey, the colour becoming more dilute as it descends on the sides; the belly and under jaw are white, and there are a few bluish-grey dots in the latter: there are also some small and regular dots on the caudal and dorsal fins; irides honey-yellow, scales having merely a moderate degree of lustre; there is a row of teeth across the tip of the tongue, and a few scattered ones on its centre, as well as the usual row on each side.

The length of the specimen from Boothia Felix is twenty-one inches.

Fins: Br. 10, 11. P 15. D 12—0. V 10. A 11. C $19\frac{1}{2}$.

INSECTS.

DESCRIPTIONS, &c.

OF THE

INSECTS BROUGHT HOME BY COMMANDER JAMES CLARK
ROSS, R.N., F.R.S., &c.

BY JOHN CURTIS, ESQ., F.L.S., &c.

However delighted the naturalist may be with the productions of his native soil, he cannot fail to take a deep interest in objects that are transported from distant regions, possessing, as they do, the charms of novelty, and frequently presenting to him new types of form, or at least species, that he has never before had the opportunity of investigating.

The little collection of Insects lately brought from the Arctic Regions by Commander Ross, is consequently highly interesting, and the observations interspersed through the following pages, from his notes, contain data and information that are very important to the entomologist.

I may here briefly observe, that all the forms in the collection of Insects are strictly European, and the greatest variety, as well as number, was found amongst the Lepidoptera, but this might arise from the insects of that order being larger and more conspicuous, and consequently more likely to attract the attention, than smaller and sometimes almost inanimate objects. I think it very probable, however, that the Coleoptera are less abundant in the Polar Regions than the Hymenoptera, Lepidoptera, and Diptera.

ORDER COLEOPTERA.

FAM.—DYTISCIDÆ.

GEN. 95.*—COLYMBETES. (*Clairv.*)

1. *Mastus*, narrow, ovate, somewhat piceous, legs castaneous, female very finely shagreened.

Length three lines, breadth one line and a half.

Antennæ yellowish-brown, ochreous at the base, trophi ochreous, palpi black at the apex; head with two ferruginous spots at the base, and an impressed line and puncture on each side the base of the clypeus; thorax with an impressed punctured line all round, deepest at the anterior margin, and a large puncture on each side; elytra very long, slightly convex, piceous and shining, with a violaceous tint in the male, dull greenish and finely shagreened in the female; the lateral margins obscure ochre, a few punctures are scattered over them, forming two or three indistinct lines; legs castaneous, underside of thighs and posterior tibiæ piceous.

This is the only beetle contained in the collection, and was found in the lakes not uncommonly; I believe specimens are also in the cabinets of the Zoological Society, that were brought home by the late Captain Lyon.

Two large beetles were captured on the 23d of June, 1831, and another on the 14th of July; they were found under stones, but were obliged to be abandoned with other valuable portions of the collections in Natural History.

ORDER DERMAPTERA.

GEN. 442.—FORFICULA. (*Lin.*)

An earwig was taken on the 23d of June, 1831, "they were scarce," Commander Ross adds, "but several were found under stones."

* The numbers of the genera refer to Curtis's Guide to an Arrangement of British Insects.

ORDER HYMENOPTERA.

FAM.—ICHNEUMONIDÆ.

GEN. 484.—ICHNEUMON. (*Linn.*)

2. *Lariæ*. Antennæ curled; rufous, tips of antennæ, head, underside of the trunk, with the coxæ, and a spot and a broad stripe on the abdomen black

Plate A, fig. 1.

Length five lines, breadth ten lines.

Clothed with very short brownish pubescence, pale castaneous, minutely punctured; antennæ and head black, the former filiform, the basal joint rufous, third and four following joints paler red; trunk black, the upper surface of the mesothorax and scutellum rufous and shining, metathorax dull and darker above, with a black furcate stripe down the back; abdomen ovate, very thickly punctured, a black dot at the base of the second segment, the third with a broad black stripe down the middle, concave on each side, the remainder black with a rufous spot on each side at the base of the fourth segment, petiole rather short, narrowed at the base; wings tinged with yellowish fuscous, nervures and stigma ferruginous ochre, areolet quinquangular; legs rather stout, coxæ and trochanters black, the former with a red spot on the upper side in the hinder pair.

This Ichneumon infested the larvæ of the *Laria Rossii*, from which it was bred early in July, another was taken on the 8th of the same month, but they were not very numerous.

GEN. 516.—EPIHALTES. (*Grav.*)

A fragment only of a female was preserved, but from the existence of the specimen it might be inferred that fir trees or stumps were in the neighbourhood. The metathorax, abdomen, sheaths of the oviduct, and posterior coxæ and trochanters are black, the remainder of the legs red, the tarsi dusky at the apex; oviduct ochreous; inferior wings transparent, nervures piceous. It is similar in form to *E. Carbonarius* (Christ.), but considerably smaller I believe.

GEN. 529.—CAMPOPLEX ? (*Grav.*)

3. *Arcticus*. Black, legs fulvous.

Length four lines, breadth seven lines and a half.

Black and pubescent; antennæ as long as the insect, subsetaceous and not very slender; head and thorax thickly but minutely punctured, the former short, the latter subglobose, abdomen shining, clavate, and slightly compressed at the apex, peduncle rather short; wings transparent, areolet very small, subtrigonal, with the base angulated, and the nervures uniting at the apex before they reach the marginal cell; nervures and stigma piceous, the latter narrow; legs fulvous, coxæ, trochanters, and tips of tarsi black; the spurs to the four posterior tibiæ rather long and slender.

GEN. 554.—MICROGASTER. (*Lat.*)

4. *Unicolor*. Black, wings nearly colourless.

Length one line one-third, breadth three lines.

Black, thickly and minutely punctured, base of the tibiæ dirty ochre, spurs at the apex brighter; wings transparent but stained with black, nervures and stigma ochreous brown, areolet imperfect.*

A male was bred from a cluster of cocoons, enveloped in a silky ball, resembling those containing the eggs of some spiders.

FAM.—FORMICIDÆ.

GLN. 661.—MYRMICA. ' (*Lat.*)

5. *Rubra*. (*Lin.*)

"In great numbers under stones."

FAM.—APIDÆ.

GEN. 723.—BOMBUS. (*Lat.*)

6. *Kirbiellus*. Black, anterior and posterior margins of the thorax and base and apex of abdomen clothed with yellowish hairs.

* Vide Curtis's British Entomology—vol. vii., folio and plate 321.

Male 7½ lines long, 16 lines broad

Female 10 . . . 20

Neuter 7 . . . 13

Male. Black, antennæ as long as the thorax, compressed at the apex; face and crown of head clothed with long yellow and black hairs; thorax yellow with hairs, having a transverse black band between the wings, basal half of abdomen yellow, the remainder orange, with a narrow black band across the middle; wings slightly yellow at the costa, the posterior margin slightly stained with brown, nervures piccous; basal joint of tarsi clothed inside with bright ferruginous hairs; spurs, base of claws, and apex of tarsi ochreous.

Female, pl. A, fig. 2.

Black, a broad margin in front of the thorax, hinder margin of scutellum, and the abdomen, excepting the third segment and the apex, clothed with long yellow-ochreous hairs; wings yellowish, excepting the posterior margin, the nervures piccous; inside of the tarsi with the pile bright ferruginous; tips of spurs, apical joint of tarsi, and base of claws subcastaneous.

Neuter. Similar to the female but much smaller, the hairs beyond the black band on the abdomen are generally orange, and the whole of the tarsi, excepting the basal joint, is subcastaneous.

I have named this bee, which seemed to be the most abundant species, after my esteemed friend the Reverend William Kirby.

7. *Polaris.* Black, clothed with yellow hairs above, with a black band across the thorax, and an indistinct one across the abdomen.

Male 6 lines long, 15 lines broad

Female, 10 . . . 20

Male. Black, clothed with yellow hairs; head black, with a patch of yellow hairs on the face, and another on the back part of the head, a blackish band across the centre of the thorax, and an indistinct narrow one on the third and fourth segments of the abdomen, the apex orange; inside of tarsi clothed with yellowish pile.

Female. Black, a broad band across the anterior portion of the thorax, the scutellum, and abdomen clothed with long yellow hairs, whitish towards the apex of the abdomen, with a few black hairs on the sides of the third segment, a band of the same colour on the fourth, and a very slight one on the fifth segment; the tarsi clothed with black pile internally, the outside of the basal joints brownish, the edges ferruginous.

A pair only of this species was preserved, in size and many respects it resembles *B. Kirbiellus*, but the indistinct and somewhat double band of black hairs across the abdomen will distinguish it, and the yellow pile inside of the tarsi in the male and the black in the female, are sufficient characters I think to justify its being separated from the former species.

8. *Arcticus*. (Kirby in the Supplement to the Appendix of Captain Parry's 1st Voyage, p. cexvi.)

An imperfect male was the only specimen brought home of the species.

As Commander Ross's observations embrace the above three species, I shall be under the necessity of embodying them; but that is of little importance, as their habits must be very similar.

"The largest bee seems to be the earliest insect on the wing; it is generally seen early in June, but the smaller specimens do not appear until the middle or end of July." It may be observed that the females are the largest, and the next in size the males; these make their appearance first, and the neuters, or working class, come later, when more flowers probably are out, and their labours are less interrupted by unsettled weather.

"The first female was seen on the 7th of June, 1830, they were very abundant on the 2d of July, and on the 14th a neuter was taken; on the following day they were very numerous, and the females less abundant, but a few were observed as late as the 18th of August, soon after which time they seem in a very weak state."

"In 1831 the first bee was seen on the 19th of June, on the 26th two females, and on the 8th of July several were captured; on the 14th many females, on the succeeding day some neuters, and on the 27th of August, 1832, a large bee was seen."

ORDER TRICHOPTERA.

FAM.—PHRYGANIDÆ.

GEN. 760.—TINODES? (*Leach*.)

9. *Hirtipes*. Slate colour, wings pale fuscous.

Length two lines and a half, breadth nine lines.

Pale slate colour, sparingly clothed with long whitish hairs; head small; eyes pro-

minent, as well as two ocelli; wings pale ochreous fuscous, pubescent and glossy, superior elongated and narrow, gradually narrowed to the base; cilia short; inferior wings iridescent; tibiæ and tarsi dull ochreous, with numerous short black bristles inside, and especially beneath the latter; the four posterior tibiæ furnished with ochreous spurs at the apex.

This insect has the habit of a *Tinodes*, but the neuration of the wings does not quite agree with any in my possession, and it has but one pair of spurs to the posterior tibiæ; if, therefore, the antennæ were not wanting, I should be disposed to give it a generic name.

ORDER LEPIDOPTERA.

FAM.—PAPILIONIDÆ.

GEN. 767.—*COLIAS*. (*Fab.*)

10. *Boothii*. Yellow, posterior margins blackish, cilia rosy; a black spot on the superior wings, the disc orange, and a spot of the same colour on the inferior.

Expansion of wings two inches.

Pl. A, fig. 3 ♂, 4 ♀, 5 underside of ♀.

Male. Antennæ crimson, the club beneath ochreous, above brown: thorax and abdomen black, clothed with long whitish hairs, rosy on the collar and head; wings sulphur colour, freckled with black at the base, and at the posterior margins forming a dentated fimbria, which vanishes before reaching the anal angle; costa and cilia rosy, the nervures sometimes rather dark in the superior wings, with a large space of orange not approaching the costa or posterior margin; at the apex of the discoidal cell is a black sublunate spot; inferior wings with a large orange spot on the disc, and sometimes a small one above it; *underside* thickly freckled with black, especially the inferior wings, but less so at the posterior margins; the entire edges of the wings are rosy; superior with a whitish dot on the black spot, which is variously formed; inferior with a large and small whitish spot on the disc, surrounded with reddish-chestnut colour, forming two tails towards the posterior margin, a spot of the same colour at the base, and frequently a lunate brown spot on the upper edge; legs rosy.

Female. Similar to the male, but the black freckled fimbria to the wings is broader

and ornamented with seven large yellow spots in the superior, and six in the inferior, which are, excepting these spots, entirely freckled with black, and have a greenish tinge; the *underside* is darker and brighter than in the male, the inferior wings and the freckled parts of the superior are green, parallel to the posterior margin is a line of sub-trigonal spots, very distinct and black in the superior, and reddish-brown in the inferior wings.

A small specimen of the male, I observe, has indistinct yellow spots on the fimbria of the superior wings, and the castaneous comet-shaped spots on the underside of the inferior are very small, and in one female the black spot in the upper, and the orange spots in the inferior wings are very large, and in another female the upperside very much resembles the male.

At the request of Commander Ross, I have named this handsome insect after Felix Booth, Esq., the munificent patron of the Expedition.

11. *Chione*. *Male*, yellow, superior wings orange on the disc, with an orange spot near the centre of all the wings. *Female?* with the nervures and a spot near the disc black, with a broad black fimbria spotted yellow.

Expansion one inch eight lines to one inch ten lines.

Pl. A, fig. 6, ♂.

Male similar to *C. Boothii*, but the spot at the apex of the discoidal cell is orange, and the posterior margins of the wings are very slightly freckled with black; the underside in some examples resembles the female rather than the male of the same species.

Female, greenish sulphur, superior wings slightly orange on the disc, with the nervures and a lunulate spot black, a broad black fimbria bearing six or seven small sulphurous spots; inferior with a similar fimbria, but less perfect, and an orange spot on the disc; *underside* pale greenish sulphur, similar to *C. Boothii*, but having only one comet-shaped spot on the under wings.

Knowing how variable some species of the genus *Colias* are,* I have great doubts if this be any more than a variety of *C. Boothii*. There are other specimens, which I believe are varieties of the female occasioned by age and other circumstances, being much paler, with the black of the nervures very much suffused, so much so in one specimen, as to render nearly the whole of the superior wings of the same colour as the fimbria.

“ These butterflies generally appear about the middle of July, as well as the two

* I need only instance *P. Electra* Linn. (*C. Edusa* Fab.), which is of a deep orange colour, yet the female is sometimes met with of a pale yellow, and during my visit to the south of France, I took one of these females paired with a male of the usual orange colour.

following species, they are chiefly found upon the *Oxytropis Campestris* and *O. Arctica*, two papilionaceous plants; they were captured from the 14th of July to the 13th of August, 1830, and on the 19th were in a very wasted state; on the 14th of July, of the following year, one *Colias* only was taken."

GEN. 770.—HIPPARCHIA. (*Fab.*)

12. *Rossii*. Brownish-black, antennæ ochreous, superior wings with two rufous spots, with a black centre; having a white pupil also on the underside.

Expansion of wings two inches.

Pl. A, fig. 7, underside of male.

Male blackish; palpi rather long and very hairy; antennæ slender and ochreous, the club elongated; wings rounded, blackish-brown, with a slight bloom of violet, superior with two red spots towards the apex, with a black pupil, the superior one the smaller, cilia dull ochre, indistinctly spotted with brown; *underside* with the disc of the superior wings chestnut colour, and two red spots towards the apex, each having a white pupil and black ocellus; inferior freckled and variegated with ochre, forming several spots towards the base, and an indistinct band beyond the centre, on the external edge of which are four ochreous dots; inside of four posterior legs pale ochreous.

Female blackish, with an ochreous shade, the rufous spots towards the apex paler, with the black pupil more or less distinct, and one or two smaller rufous spots between them and the posterior angle; the antennæ are dotted with black on the upper side, and the club is dark above and very much compressed; *underside* with the superior wings more rust-coloured, and the two spots ochreous; the spots and fascia on the inferior wings more distinct, the margins of the latter, especially the hinder one, dentated.

This very distinct *Papilio*, I have the pleasure of dedicating to my friend Commander James Clark Ross, F.R.S., &c., whose zeal for natural history is equalled only by that enterprise and energy which have characterized all his undertakings, and carried him so successfully through his various voyages to the Arctic Regions.

Five specimens only were brought home, "they were scarce, and frequented the precipitous faces of dark-coloured rocks and loose stones. I never found," says Commander Ross, "any of them on flowers of any kind. A few specimens were obtained on the 18th and 25th of July, 1830, and one on the 14th of the same month the year following."

13. *Subhyalina*. Wings semitransparent, fuscous, costa freckled with black and white, two small black spots towards the apex with white pupils, most distinct on the underside.

Expansion one inch eleven lines.

Male black, antennæ ochreous, the club elongated; wings semitransparent, pale fuscous, nervures ochreous, costa black, freckled with white; two indistinct white dots towards the apex with blackish ocelli, cilia whitish, spotted with black; *underside* of superior wings similar to the upper, but the ocellated spots are distinct, and the surface, excepting the disc, is mottled with ochre and pale black, brightest at the apex; inferior wings spotted and mottled with black and dirty white, forming a waved and curved pale line beyond the middle, with three or four whitish dots beyond it.

A single male was preserved, and probably was taken with the last species, of which, at first sight, I thought it had been only an old and faded specimen, but on examination it proved to be in good condition.

GEN. 775.—MELITÆA. (*Fab.*)

14. *Tarquinus*. Wings tawny, spotted with black, inferior wings beneath with several pearly spots edged with black, an irregular pearly line beyond the middle, and seven spots of the same on the margin.

Expansion from one inch six lines to one inch ten lines.

Black, antennæ with a large spoon-shaped club, the tip and underside tawny; palpi somewhat ochreous beneath, freckled with scarlet outside; wings tawny orange, black at the base, superior with three long black spots on the discoidal cell, and a waved line across the middle formed of black crescents, beyond is a row of six black spots, and close to the posterior margin a line of Λ 's, alternating with the same number of spots, which variegates the white cilia; inferior similarly marked; *underside*, superior wings paler, sometimes ochreous at the tip, variegated with ferruginous, the spots from the upper side apparent, but smaller and fainter; inferior wings reddish-brown, a little variegated with ochre, with three pearly spots at the base, a v shaped one, and two larger elongate-trigonal spots, margined with black beyond them, across the middle is a row of black Λ 's, with an irregular line of pearly crescents, with six small black spots beyond it, and seven pearly spots on the margin, edged internally with black Λ 's, the superior margin is also pearly, the cilia pale ochreous spotted with black; legs dull ochreous, thighs scarlet on the upperside.

As this insect does not agree with the *P. Tullia* of O. Fabricius, and I have reason

to believe that several species have been detected in the Polar Regions, I have carefully described it and given it a name.

M. Tarquinius was an abundant species, and like the *Coliades* was found feeding on the flowers of *Oxytropis Campestris* and *O. Arctica*; specimens were captured on the 10th of June, and between the 2d and 14th of July, 1830, they were most abundant; in 1831 the first butterfly seen was one of this species; this was the 10th of July, and on the 14th two more were taken. Commander Ross was so fortunate as to discover the caterpillar apparently of this species, from its structure resembling those larvæ that are known of the European *Melitææ*. "I do not know the caterpillar of any of the butterflies, unless it be that of the *Melitææ*, of which I made the following description. It measured exactly an inch in length, by 0.22 of an inch, it was composed of thirteen segments besides the hindmost one; the first and last segments with two, the second and twelfth segments with four, and all the other segments of the body with six prickles or horns, and disposed in rows and equidistant on each side of the back. Colour dark brown, with a line of white spots along each side. Some caterpillars I have seen entirely of a blackish-brown, or rather brownish-black; one that was found under a stone in the middle of March, and of course perfectly hard frozen, showed symptoms of life in half an hour after being brought into the cabin, and in less than an hour it was walking about the table. It is thus described in my note book, and differs so much from the others, that it probably belongs to another species. Length 0.75 of an inch; three rows of prickles on each side of the back; twelve ribs or segments and a white dorsal line along the back; colour above brownish-black, beneath clove-brown." It possibly may be the same caterpillar in an earlier stage, as the different skins vary considerably.

GEN. 779.—POLYOMMATUS. (*Lat.*)

15. *Franklinii*. Silvery grey, with a black ocellated dot on the centre of each wing, beneath brown, with numerous white spots, those on the upper wing with large black pupils, in the under wings with only small ones or none.

Expansion from eleven to thirteen lines.

Pl. A, figs. 8 and 9.

Black with bluish hairs, palpi bluish white, margins of eyes silvery white; antennæ dotted with white, club orange, excepting the back; wings greyish powdered with silvery green, especially at the base, the spots on the underside slightly visible, a black spot on the disc on each wing with a whitish margin; the edges of the wings fuscous,

the posterior with a line of indistinct whitish ocelli along the margin; cilia white; *underside*, superior wings with a white spot towards the base, and another on the disc with a long black pupil, beyond them is a curved line of six black spots ocellated with white, and near the posterior margin the same number of indistinct kidney-shaped blackish spots margined with white; inferior wings fuscous freckled with gold, but blue at the base, five whitish spots towards the base, the three outer ones with black pupils, four similar ones in a line beyond the middle, touching a row of eight whitish lunules bearing blackish spots, two towards the centre being the largest, and sometimes crescent-shaped; legs bluish-white.

I have named this pretty species after Sir John Franklin, whose overland expeditions in the Northern Regions have so greatly contributed to our knowledge of the geography and natural history of that part of the world.

“Only two individuals of this species were taken; they were feeding on *Astragalus Alpinus* near the end of July.”

FAM.—BOMBYCIDÆ, OR ARCTIIDÆ.

GEN. 814.—LARIA. (*Schr.*)

16. *Rossii*. Transparent grey, superior wings with two blackish waved lines forming a fascia across the middle, with a spot between them, and a similar sinuated line beyond them; inferior wings cream colour, ochreous inside with a blackish fimbria.

Expansion of male one inch eight lines, female one inch ten lines.

Pl. A, fig. 10.

Male yellowish-grey, a spot on each shoulder, and the abdomen darker; superior wings semitransparent, the costa blackish interrupted with grey, a waved blackish line before and another beyond the middle, with a crescent-shaped spot at the extremity of the discoidal cell, and a very sinuated and dentated line near to the posterior margin; cilia blackish, spotted with ochre; inferior wings cream colour, the abdominal margin ochreous, as well as the cilia, with a blackish fimbria.

Female apparently paler, but very much injured.

I have named this very distinct moth after Captain Ross, who first penetrated these inhospitable regions, and to whom we are indebted for many additions to our zoological collections.

It is a very abundant insect, especially in the caterpillar state, for about a hundred

were collected on the 16th of June, 1832, near Fury Beach; the first that was seen in the previous year was on the 19th of June, and several more on the 23d. The caterpillar is large and hairy, of a beautiful shining velvety black, the hairs being somewhat ochreous, there are two tufts of black hair on the back, followed by two of orange. A great number of them are destroyed by several kinds of flies and ichneumons, one of which is represented at fig. 1; but those that arrive at maturity spin a close web, about the size of the silkworm's, and covered outside with its hairs, the pupa is piceous and shining, and the back thickly clothed with long brownish-ochre hairs its whole length; the moth appears about the beginning of August. The following interesting experiments I have transcribed from Commander Ross's MSS. "About thirty of the caterpillars were put into a box in the middle of September, and after being exposed to the severe winter temperature of the next three months, they were brought into a warm cabin, where in less than two hours, every one of them returned to life, and continued for a whole day walking about; they were again exposed to the air at a temperature of about 40° below zero, and became immediately hard frozen; in this state they remained a week, and on being brought again into the cabin, only twenty-three came to life; these were at the end of four hours put out once more into the air, and again hard frozen; after another week they were brought in, when only eleven were restored to life; a fourth time they were exposed to the winter temperature, and only two returned to life on being again brought into the cabin; these two survived the winter, and in May an imperfect *Larva* was produced from one, and six flies from the other; both of them formed cocoons, but that which produced the flies was not so perfect as the other." The caterpillar "feeds mostly on the *Saxifraga tricuspidata* and *S. oppositifolia*.

GEN. 820.—EYPREPIA. (*Ochs.*)

17. *Hyperboreus*. Castaneous brown, superior wings with a spot on the costa, and an interrupted stripe towards the hinder margin cream colour; inferior wings with an orange band across the middle, bearing a brown spot; the margin orange also.

Expansion one inch eleven lines.

Male castaneous brown, antennæ black, the rays short; the superior wings with a cream coloured spot at the middle of the costa, and a waved stripe of the same colour near the posterior margin, nearly divided in the middle; inferior wings ochreous freckled with scarlet, castaneous brown at the base, an elongated spot at the middle, and a sinuated fascia beyond it of the same colour; margin of the abdomen, upper side of

the thighs, and underside of wings vermilion, variegated with the ochre and brown of the upper surface.

On the 8th of August, this splendid moth was brought on board by one of the men, it was the only one seen, and too much injured for drawing. In a former voyage a similar insect was brought home by Captain Lyon, this may therefore be only a remarkable variety.

FAM.—NOCTUIDÆ.

GEN. 849.—HADENA.* (Schr.)

18. *Richardsoni*. Brown and pale grey, the upper wings with an ear-shaped and two other spots on the disc, and two denticulated strigæ beyond them; inferior, dirty white, the base and a fimbria fuscous.

Expansion one inch five lines.

Pl. A, fig. 11.

Male pale grey, palpi and antennæ black, the latter ciliated beneath;† head and thorax variegated with black; abdomen fuscous; superior wings brown, the costa spotted with grey and black, two grey waved strigæ near the base edged with black, with a small black oval attached to the second, above it is a small black ring united to a larger ear-shaped spot, beyond them is a curved denticulated grey striga edged inside with black, and a darker one near to the posterior margin; cilia whitish, spotted with black; inferior wings ochreous white, a lunulate spot on the disc, the base and fimbria pale black; legs spotted with black; wings beneath yellowish-white, with a fuscous lunulate spot on the disc of each, and a fimbria of the same colour.

I have named this very distinct moth after Dr. Richardson, the friend and companion of Sir John Franklin.

Two males only were brought home, they were captured on the 25th of July, 1830, and it was by no means a numerous species. It considerably resembles the *Noctua Lappo* of Godart, but is at once distinguished by the white on the under wings, and it is worthy of remark, that the only specimen I have seen of that moth was captured in Forfarshire, Scotland, and presented to me by Charles Lyell, Esq.

* For the character of this genus, see Curtis's Brit. Ent.—fol. 308.

† The tips are represented as in the specimen; they appear to be broken off.

FAM.—PHALÆNIDÆ.

GEN.—PSYCHOPHORA. (*Kirby.*)

Antennæ rather short and setaceous, bipectinated in the male, simple in the female; the rays very short at the base, and vanishing towards the apex; each joint producing two, which are clavate and pubescent (fig. 7 a); *maxillæ* long and spiral; *palpi* projected horizontally, short and very hairy, projecting a little beyond the head; *head* and *eyes* rather small; *thorax* subglobose and hairy; *abdomen* short subcylindric, tufted at the apex in the male with a pair of horny incurved spoon-shaped forceps; *wings*, superior subtrigonal, the apex a little angulated in the female; *legs*, posterior a little the longest; *tibiae*, anterior short, with an internal spine, the others longer, with a pair of spurs at the apex, the posterior with a pair also below the middle; *claws* simple and distinct.

19. *Sabini.* (*Kirby.*) Cinereous, superior wings with an obscure dark patch at the base, and a slightly angulated fascia across the middle narrowed at the interior margin, the edges sinuated, with a dot on the disc; inferior wings paler, with two obscure transverse lines; underside whitish-cinereous, with a fuscous spot on the costa; the cilia spotted fuscous.

Expansion from one inch to one inch and two lines.

Plate A, fig. 12, male; fig. 7, the head in profile.

Mr. Kirby's description being incomplete, from his want of perfect specimens, I have endeavoured to supply the deficiency by giving the generic characters. When I published the genus *Psodos* (*Treit.**), I thought, from the observations of Mr. Kirby, that *P. trepidaria* might be allied to his genus *Psychophora*, if not synonymous, but I am now satisfied that it is considerably removed from it. It bears considerable resemblance to the genus *Thera* (*Ste*), but is most probably allied to *Zerynthia*.†

GEN. 915.—OPORABIA. (*Ste?*)

20. *Punctipes.* Cinereous, superior wings with an oblique fascia, and several pale waved strigæ; legs spotted with white.

* Curtis's Brit. Ent.—vol. ix., pl. 424.

† Ib.—vol. vii., pl. 296.

Expansion one inch and two lines.

Antennæ blackish, setaceous, pubescent beneath; maxillæ long and spiral; palpi short, not very thickly clothed with scales; superior wings cinereous, with a darker patch at the base, a faint oblique fascia across the middle; narrowed towards the interior margin, the edges crenated, with two very waved pale lines between it and the base, and three beyond it, and a dot on the disc; cilia spotted; legs fuscous, tips of all the joints of the tarsi, of the tibiae, and a spot on the centre of the latter, white; the middle tibiae are spurred at the apex.

An imperfect specimen, wanting the body and under wings, was brought home.

FAM.—TORTRICIDÆ.

*GEN. 960.—ORTHOTÆNIA. (Ste.)

21. *Bentleyana*. (Don.) Ochreous brown, superior wings variegated with numerous whitish silvery spots, forming irregular lines, with a distinct round one at the centre, the costa spotted brown and white, each of the white dots bearing a brown one; inferior wings pale fuscous.

Expansion from ten to twelve lines.

Bentleyana. Don: *Brit. Ins.*—vol. x., pl. 357, fig. 1.

Pinetana. Hub: *Tort.*—pl. 10, fig. 57?

I believe several specimens were taken the 2d of July, 1830, and the 14th of the same month the following year. This is an interesting discovery, as it shows the distribution and times of appearance of a small moth. In ascending Schiehallien in company with my friend Mr. Dale, on the 11th of July, 1825, we met with this insect in great abundance on the north side, near and at the top, upon the turf amongst the rocks; we found it in a subsequent year amongst heath, at an elevation of about 1000 feet, on mountains in the neighbourhood of Ambleside in the middle of June, and afterwards at Trafford, near Manchester.

22. *Septentrionana*. Dark brown, superior wings with a darker oblique fascia, the costa spotted with white; inferior wings fuscous white.

Expansion seven lines.

Blackish-brown, superior wings somewhat variegated with grey, with an indistinct oblique band across the middle, narrowest at the costa, which is marked with six or

seven silvery white rays, several of them divided by a darker line; cilia ochreous white, spotted at the base with brown; inferior wings, legs, and underside, pale fuscous white.

The box contained two specimens of this small Tortrix, which resembles a little the *T. hybridana* of Hübner, pl. 38, fig. 238.

GEN. 964.—ARGYROTOSA? (Ste.)

23. *Parryana*. Grey, superior wings with an angulated brown band near the base, an incomplete one across the middle, and the apex of the same colour.

Expansion eight lines.

Pl. A, fig. 13.

Brown, head and sides of thorax inclining to ferruginous, apex of abdomen ochreous; superior wings pale grey, with a lilac tinge, and delicately tessellated with brown, an angulated brown band near the base, indistinct at the costa, and another at the middle, vanishing at the interior margin, very narrow at the costa, and angulated and dilated outside at the disc, a round spot of the same colour at the tip, and three smaller ones approaching it on the costa; inferior wings a little paler, the margin and cilia ochreous-fuscous.

The antennæ were broken off of the only specimen preserved of this very distinct Tortrix, which I have named after Sir William Edward Parry.

ORDER XIII.—HEMIPTERA.

FAM.—ACANTHIDÆ.

GEN. 1094.—ACANTHIA. (Lat.)

24. *Stellata*. Blackish sericeous, elytra with a pale spot at the centre, and several at the apex; legs ochreous.

Length three lines.

Black, clothed with very short shining hairs; thorax transverse; the edges beneath subochreous, as well as the centre of the antepectus; scutellum rather large; elytra with the costa reflexed at the base, a semitransparent spot at the base, another on the

disc, and eight or nine arranged in a circle on the submembranous apex; margins of abdominal segments beneath ochreous, and forming a row of dots down each side; legs dirty ochre somewhat freckled with piceous.

The head is wanting to the only specimen I have seen; it most resembles *A. Zosteræ* of Fabricius, but is very distinct from my examples of that insect; as some of its larvæ or pupæ were found, it is probably not uncommon in the Polar Regions.

GEN. 1094 a.—PEDETICUS? (*Lap.*)

25. *Variegatus*. Black, sides of thorax and numerous spots on the elytra whitish ochre; legs spotted with white and ochre.

Length two lines and one-third.

Black, clothed with shining pubescence and black hairs; eyes large, very globose and prominent, subferruginous striped with black, the clypeus, excepting a stripe down the middle, apex of the labrum, internal margin of the eyes, and a triangular spot on each side beneath, ochreous; thorax trapezate, gibbose on the back, with a fovea at the centre, the base very concave, the sides pale ochreous; elytra with a pale ochreous patch near the base, another beyond the middle, and a semiorbicular one at the apex, divided into several spots by the black nervures, each bearing a blackish dot; legs hairy; antepectus, coxæ, trochanters, and base of thighs, excepting the anterior, whitish ochre, the thighs striped beneath with black; the tips, two broad bands on the tibiæ, excepting the posterior, and the apical portion of the basal joint of the tarsi, ochreous.

ORDER XV.—DIPTERA.

FAM.—CULICIDÆ.

GEN. 1137.—CULEX. (*Lin.*)

26. *Caspicus*. (*Pall.*) Black, head and thorax griseous, abdomen with seven white bands.

From two to three lines long, from four to six broad.

C. *Pipiens*. *Fab: Faun. Grænl.*—p. 209, n. 171.

Several females, but not one male, were brought home; this may be accounted for,

either from the males appearing earlier or later, or from their not being sanguinary; I have frequently for a week together found the females of *Culex annulatus* congregated in summer-houses in gardens, without being able to discover a single male.*

Commander Ross remarks, "Of this genus only one species was observed. It first appeared about the 10th of July, on the 15th it became very numerous, and on the 22d so extremely troublesome, as to prevent the necessary duties of the ship. They were in perfect clouds over the marshes, and their larvæ constitute the principal food of the trout that inhabit the lakes. It was only in the beautiful summer of 1830 that we found them so very numerous. On the 13th of August of that year they came out again after the rain, but were no longer very troublesome, being apparently nipped by the frost at night; indeed soon after this time the ground was again covered with snow, and all entomological observations were terminated."

FAM.—TIPULIDÆ.

†GEN. 1140.—CHIRONOMUS. (Meig.)

27. *Polaris*. (Kirb.) Black hairy, wings lacteous, iridescent, the costa fuscous, with the nervures darker, halteres dirty ochre.

Length three lines and three-fourths, breadth six lines.

Ch. *Polaris*. Kirby in *Supp. to App. of Capt. Parry's 1st Voyage*—p. ccxviii.

Pl. A, fig. 14, female; fig. 2, head of same in profile.

No males of this species were brought home, and only three females, none of which retained their first pair of legs, which are therefore merely sketched in the plate to show their situation.

28. *Borealis*. Black, thorax grey, abdomen with seven whitish rings; costa fuscous; legs lurid.

Length three lines, breadth six lines.

Black, basal joint of antennæ ochreous; thorax hoary; abdomen clothed with long subdepressed yellowish hairs, the margins of the segments shining whitish or silvery; wings lacteous, opalescent, the costa fuscous, the nervures darker; halteres yellowish; legs dull castaneous ochre, tips of the thighs and tarsi fuscous.

Only one specimen has come under my observation, and that had lost its antennæ and some of its legs.

* Curtis's Brit. Ent.—vol. xii., fol. 537.

† Ib.—vol. ii., fol. 90.

GEN. 1160.—TIPULA. (*Linn.*)

Division A with the fourth cell of the wings peduncled.

29. *Arctica*. Cinereous, wings clouded with brown; legs subferruginous, tarsi fuscous.

Length ten lines and a half or eleven lines, breadth one inch and seven to eight lines.

Pl. A, fig. 15, female; fig. 4, underside of apex of abdomen of the same.

Silky slate colour; thorax with a brown line down the centre, a stripe of the same colour on each side, furcate at the base; abdomen more cinereous, the incisures slightly ochreous, the apex horny, with a large oval picuous and shining shield above, terminated by two moveable, lanceolate, serrated, and ferruginous lobes, curved at the apex, the penultimate joint furnished with two long slender spines beneath (fig. 4); wings clouded with brown, forming a spot on the stigma and another behind it, and leaving several large transparent and irregularly-formed spots along the disc, the costa and base are ochreous, the nervures dark brown; halteres dull and pale ochreous, fuscous at the tip; legs dull ferruginous, tips of thighs, tibiae, and tarsi, black.

Specimens only of the female were preserved, and none of them had antennæ, or the anterior feet. "They appeared," says Commander Ross, "about the same time as the *Culex*, and were equally numerous. Their larvæ are the principal food of the plover and other birds that seek their prey in the marshes, as was proved on the 27th of June, when great numbers of the larvæ of the *Tipula*? were taken from the stomach of a gull that had been feeding in the marshes."

This fine species of *Tipula* is remarkable for the singular termination to the apex of the abdomen, being, I imagine, an extraordinary development of the sexual organs. I have never seen any other species like it in this respect, excepting one lately described under the name of *T. montana*,* which has the same horny shield and broad serrated forceps, and it is worthy to be observed that this species is attached to elevated districts in the north, having only been found on Skiddaw and mountains of Scotland in July, by Mr. Dale and myself.

FAM.—SYRPHIDÆ.

†GEN. 1245.—HELOPHILUS. (*Meig.*)

39. *Bilineatus*. Black, pubescent, two pale lines on the thorax, six lunulate spots on the abdomen, the first two yellow, as well as the base of the tibiae.

* *Curtis's Brit. Ent.*—vol. xi., fol. 493, no. 9 a.

† *Ib.*—vol. ix., fol. 429.

Length four lines and a half to six lines, breadth nine to ten lines and a half.

Black, clothed with short yellowish pubescence; face yellow or white with very short hairs, excepting a black shining space down the middle; antennæ brown except at the base, the seta ochreous; thorax with two narrow yellow lines down the fore part of the back; scutellum dull ochreous; abdomen with a rather large bright ochreous trigonate-lunate spot on each side at the base, and colouring the sides of the first segment beneath, the two following with a transverse yellow lunate spot on each side, the first pair sometimes being bright ochreous outside; base of wings and costa tinged with dull yellow, stigmatic spot fuscous, nervures black, alulae and halteres ochreous; base of the tibiae, and sometimes the apex of the thighs, ochreous.

The box contains three specimens.

FAM.—MUSCIDÆ.

GEN. 1276.—TACHINA. (*Ill.*)

31. *Hirta*. Black, very bristly, face silvery, hairs on back of head grey, scutellum subochreous.

Length six lines, breadth ten lines.

Black, pubescent, and covered with long bristles, especially the abdomen; head trigonate, silvery-white, excepting the crown, the hairs behind the eyes grey; eyes naked; antennæ with the third joint long and elliptical, seta stout at the base; thorax with four indistinct whitish lines before; scutellum tawny except at the base; wings similar to fig. 23, tab. 41, of Meigen, yellowish-brown at the base; squamulae ochreous.

A single specimen was preserved, which I believe was bred from the *Laria*.

GEN. 1287.—ANTHOMYIA. (*Meig.*?)

32. *Dabia*. Cinereous, eyes margined with white, thorax with three fuscous stripes. Two lines long, three lines and a half broad.

Grey-ash colour, sparingly pilose; antennæ with the basal joint minute, the second subtrigonate, third scarcely larger and oblong; eyes reddish-brown, face dull shining white, crown of head ash colour; thorax with three fuscous stripes down the back, and an indistinct one on each side; wings rather broad, iridescent, the nervures and legs black.

I have little doubt of this small fly being an *Anthomyia*, but as neither of the specimens had any setæ to the antennæ, I cannot determine the genus with certainty.

*GEN. 1293.—SCATOPHAGA. (*Meig.*)

33. *Apicalis*. Cinereous, very pubescent, face, apex of abdomen, and legs, castaneous.

Male, four lines two-thirds long, eleven broad; *female*, four lines long, nine broad.

Male. Cinereous, thickly clothed with fine long brown hairs, especially the abdomen and legs; antennæ blackish, two basal joints rufous, seta slightly pubescent only; lip horny and black; head with a furcate space before the crown, the face and palpi reddish-orange; thorax with a double ash-coloured line down the middle, and an obscure one on each side; abdomen elongate-ovate, with the margin of the third segment, and the following joints, entirely ferruginous; wings tinged with yellow, the costa and base of a much deeper and brighter colour, the nervures ochreous, excepting the two transverse ones, which are fuscous, and suffused, as well as the longitudinal ones connecting them; halteres and legs pale castaneous.

Female much less hairy, especially the abdomen and legs, the former being ovate, the second segment sometimes having the margin ferruginous, and a greater portion of the third, as well as the apex, of the same colour.

A male and two females of this handsome species were preserved.

34. *Fucorum*. (Fall.) "Obscure cinereous; thorax with four black lines; palpi, antennæ, and legs, black."—*Meig.*

Male, length three lines, breadth six lines; *female* rather smaller.

Meig: *Syst. Besch.*—vol. v., p. 253, n. 14; tab. 45, f. 29.

This insect is common in Sweden amongst seaweeds, from which circumstance Fallen has named it *Fucorum*. Commander Ross brought home a pair of flies that agree so well with the above description of Meigen, that I consider them identical.

* Curtis's Brit. Ent.—vol. ix., fol. 405.

MARINE INVERTEBRATE ANIMALS.

THE following account of the Marine Invertebrate Animals, inhabiting those parts of the Arctic Ocean visited in the course of our late expedition, is very incomplete owing to nearly the whole collection having been necessarily abandoned with the Victory. Some few, however, of those that were considered to be most interesting, as forming the types of new genera, were brought by us to England, and specimens of each have been deposited in the valuable museum of the Royal College of Surgeons.

The arrangement and generic characters adopted in this notice, is that of Latreille in the last edition of Cuvier's "*Règne Animal*."

J. C. R.

CRUSTACEA—DECAPODA.

1.—CRANGON BOREAS.

CRANGON BOREAS.—*Lat. Cuv: Règ. Anim.*—vol. iv., p. 94.

Lam: Hist. Nat. des Anim. sans Vert.—vol. v., p. 201.

Sab: Supp. to Parry's 1st Voyage—p. ccxxxv.

Ross, App. to Parry's 3d Voyage—p. 120; and *Polar Voy.*—p. 205.

CANCER BOREAS.—*Phipps's Voyage, Appendix*—p. 194, plate 11, fig. 1.

Zool. Dan.—vol. iv., p. 14, plate 32, fig. 1.

Several specimens of this very fine species of Crangon were obtained, by means of

a dredge, near Felix Harbour. It was also taken at a short distance from the west coast of Greenland, but seems to have entirely escaped the notice of Fabricius. We have in former voyages found it abundantly in various other parts of the Arctic Seas, but nowhere so numerous as near the Low Island (of Phipps), Spitzbergen, where it was first discovered. It has recently been brought from the shores of Kamtschatka and California, by Captain Beechey, as have also several hitherto undescribed species of Crustacea, but of which no account, it is much to be regretted, has yet been published.

2.—SABINEA SEPTEMCARINATA.

CHAR. GEN.—*Antennæ superiores* setis duabus in eâdem ferè lineâ horizontali insertis: inferiore longiore. *Inferiores corpori breviores*, setaceæ, squamâ ad apicem externè unidentatâ pedunculo adnexâ: articulo primo ad squamæ medium non producto.

Palpi pediformes articulis quatuor exsertis; duobus ultimus longitudine æqualibus.

Pedes decem; par anticum majus compressum subdidactylum par secundum *brevissimum tenue inunguiculatum*, par tertium tenue præcedente longiore subcrassiore ungue simplici instructum; paria 4 et 5 præcedente crassiora unguibus compressis instructa.

CHAR. SP.—*Sabinea* thorace septemcarinato; carinis serratis.

CRANGON SEPTEMCARINATUS.—*Sab*: *Supp. to Parry's 1st Voyage*—p. cccxxvi., pl. 2, fig. 11—13.
Ross, App. to Parry's Polar Voyage—p. 205.

Owing to the peculiar formation of the second pair of legs, in this singular animal, it has become necessary to establish a new genus, of which it is the only known species; and I have much pleasure in dedicating it to my friend, Captain Edward Sabine, of the Royal Artillery, by whom it was discovered in the west coast of Davis's Straits, during Sir Edward Parry's first voyage to those regions. His very accurate description is as follows: "Length four inches; colour varied, red and white above, white beneath; thorax seven carinate, the three lateral carinæ on each [side serrate, the middle one with strong spines; rostrum short, curving down between the eyes, grooved in the centre; the five upper carinæ carried on in very faint rudiments along the back; the terminal setæ of the superior antennæ inserted nearly in the same horizontal line, the interior one being the longest; the first joint of the inferior antennæ scarcely produced beyond the middle of the squama; a strong spine in the abdomen directed forward between the chelate legs; the last joint of the pediform palpi subacuminate,

rather longer than the preceding; second pair of legs slender, very short, bristled, and unarmed, in which last essential point it differs from the *Pontophilus spinosus* of Dr. Leach, *Mal. Pod. Brit.*, t. 37, to which in other respects this species bears a near resemblance."

It is more rarely met with in the Arctic Seas than the Crangon Boreas, but a few specimens were obtained near Felix Harbour. It was also found in a previous voyage near the island of Igloolik in considerable numbers.

3.—HIPPOLITE ACULEATA.

ALPHIEUS ACULEATUS.—*Sub: Supp. to Parry's 1st Voyage*—p. ccxxxvii., pl. 2, figs. 9 & 10.

Ross, App. to Parry's 3d Voyage—p. 120; and *Polar Voyage*—p. 206.

CANCER ACULEATUS.—*Fab: Faun. Græcul.*—p. 239.

Λ. (II.) thoracis carinâ dentibus quatuor, margine antico trispinoso, segmentis utrinque aculeatus, palpis peditorum apice spinulosis. (*Sabine.*)

The Alpheus Aculeatus and A. Polaris of Sabine, belong to the genus Hippolite of Leach (*Mal. Pod. Brit.*), on account of the second pair of claws being shorter than the first. This arrangement, which appears to be now universally agreed to by naturalists, is adopted by Latreille in the "Règne Animal," and is therefore followed in this notice. It is an abundant species in the Arctic Seas.

4.—HIPPOLITE SOWERBEI.

Plate B, fig. 2.

HIPPOLITE SOWERBEI.—*Leach, Mula. Pod. Brit.*—t. 39.

GAMMARUS SPINOSUS.—*Sowerby, Brit. Mis.*—vol. ii., pl. 21.

H. rostro alto obtuso supra multi-serrato, apice emarginato serrulato; subtus uni-serrato. (*Leach.*)

This species was first described by Mr. George Sowerby, in the "British Mis-

cellany," *loc. cit.* It was taken near the Scottish coast; and Dr. Leach received an imperfect specimen from the Firth of Forth, but it appears to be of very rare occurrence in those parts. During one of our former voyages, we found it near the island of Igloodik in considerable numbers, associated with the preceding and following species. Some specimens were obtained by us, through a hole in the ice, at Felix Harbour, in the very depth of winter.

The general form of the rostrum agrees with that figured by Dr. Leach, but many have it simply emarginate at the apex, and not serrulate.

It differs from the two following species in the dentations of the carina of the thorax, extending along its whole length; and in the upper part of the third segment of the body being produced posteriorly in a strong spine.

5.—HIPPOLITE BOREALIS. (*n. s.*)

Plate B, fig. 3.

HIPP. thoracis dimidio posteriore lævi, anteriore sub-carinato, margine anteriore utrinque bi-spinoso.

The principal differences, as compared with the A. (H.) *Polaris* of Sabine, consist in the absence of, or very slightly marked, dentations on the thoracic carina; in having only two spines, instead of three, on either side of the anterior margin of the thorax (that at the junction of the lateral margin being wanting in H. *Polaris*); in the superior antennæ being proportionally longer; and in being of a paler yellow colour, without the red spots and markings of the H. *Polaris*. As in the specimens of H. *Polaris* obtained by me, the middle lamella of the tail has from eight to ten minute spines along each side, and is terminated by several strong setæ, the margins of the rest of the plates of the tail are beautifully ciliated, excepting on the exterior edge of the lateral plates, which are toothed at their posterior angle.

Dr. Leach takes his specific characters from the rostral dentations, but these, as Captain Sabine justly remarks, in his description of *Alpheus (Hippolite) Polaris*, agree in no two specimens of that species, as to number, nor the rostrum as to shape.

H. *Borealis* was found associated with the preceding species, and was dredged up

from a depth of eighty fathoms off Elizabeth Harbour. It was also found in considerable numbers near the island of Igloolik on a preceding voyage.

6.—HIPPOLITE POLARIS.

ALPHEUS POLARIS.—*Sab: Supp. to Parry's 1st Voyage*—p. cccxxxviii., pl. 2, figs. 5—8.

Ross, App. to Parry's Polar Voyage—p. 206.

A. thoracis dimidio posteriore laevi, anteriore carinato serrato; chelis et unguibus apice nigris. (*Sabine.*)

The excellent description and plate referred to above, render any further remark unnecessary, except that the rostral dentations are usually more numerous, both above and beneath.

It is an abundant species in the Arctic Seas.

7.—MYSIS FLEXUOSUS.

MYSIS FLEXUOSUS.—*Lam: Hist. Nat. Anim. sans Vert.*—vol. v., p. 200.

CANCER FLEXUOSUS.—*Mulh: Zool. Dan.*—vol. ii., p. 34, pl. 66.

CANCER MULTIPES.—*Montague, in Trans. Linn. Soc.*—vol. ix., tab. 5, fig. 3.

CANCER OCULATUS.—*Fab: Faun. Grænl.*—p. 245, pl. 1, figs. A and B.

PRAUNUS FLEXUOSUS.—*Leach, in Edin. Encycl.*—vol. vii., p. 401.

Though but sparingly found in the seas of Europe, it inhabits some parts of the Arctic Ocean in amazing numbers, and constitutes the principal food of the prodigious shoals of salmon, that resort thither in the months of July and August, and upon which the inhabitants of Boothia depend, in a great measure, for their winter store of provisions. It is also the chief food of the whale, by which such a prodigious quantity of fat is produced in the body of that immense animal.

During the summer they assemble in vast myriads at the mouths of rivers, but in the winter are more generally distributed along the whole line of coast, and, together with

the *Argonauta Arctica*, are to be seen in every crack that opens with the tide, even at the coldest period of the year.

It is called by the natives Il-le-ak-kak.

AMPHIPODA.

8.—THEMISTO GAUDICHAUDII.

TH. corpore elongato, luteo ; capite globoso ; antennis inferioribus longioribus ; pedibus inæqualibus, quinto pari longissimo ; caudæ appendicibus planis, ciliatis. (*Guér.*)

This singular animal was first described by M. F. E. Guérin, in a paper entitled "Mémoire sur le Nouveau Genre Thémisto," &c., communicated to the Society of Natural History at Paris, August 29, 1828, and published soon after in the fourth volume of the memoirs of that society.

The specific name is in honour of Dr. Gaudichaud, one of the naturalists of the corvette *La Coquille*, during a voyage round the world, under the command of Captain Duperrey, by whom it was collected, together with a number of other curious specimens of marine invertebrate animals.

M. Guérin's minute and accurate description is exceedingly well illustrated by a lithographic delineation of the various parts that compose this singular and interesting genus. The individual selected for description was smaller than those met with by us during our late voyage to the Arctic Regions, our specimens being as large as M. Guérin's second or magnified figure ; in every other particular they agree with his description, of which the following is an extract :

"Corps oblong, composé de douze segmens ;* tête occupée entièrement par deux yeux à réseau, arrondie, non prolongée inférieurement en rostre. Quatre antennes, les supérieures plus courtes que la tête, courbées au bout ; les inférieures beaucoup plus longues. Quatorze pieds ; les quatre premiers courts, dirigés en avant, couchés sur la bouche, et représentant les deux dernières paires de pieds-machoières des crustacés supérieurs ; les quatre suivans beaucoup plus grands, terminés par un crochet dirigé

* Not including the head.

vers la queue; la cinquième paire très-longue dirigée vers la bouche, ayant l'avant-dernier article grêle, fort long, garni d'épines en dedans et terminé par un crochet; les quatre derniers, de moitié plus courts, dirigés et conformés de même, mais sans dents à l'avant-dernier article. Queue terminée par six appendices natatoires longs, aplatis, bifides à l'extrémité; trois paires de filets également natatoires sous les trois premiers segments de la queue."

It is most nearly allied to *Hyperia* of Latreille and *Phrosina* of Risso,* but differs from the former in the great length of the fifth pair of legs, and in the inferior antennæ being longer than the superior; and from *Phrosina*, in the greater length of the antennæ, and in the head not being prolonged inferiorly *en rostre*.

It is a singular circumstance in the history of this animal, that it has hitherto been found only in the vicinity of the Falkland Islands, and near the west coast of the peninsula of Boothia.

9.—GAMMARUS NUGAX.

GAMMARUS NUGAX.—*Sub: Supp. to Parry's 1st Voyage*—p. cccxix.

TALITRUS NUGAX.—*Ross, App. to Parry's 3d Voyage*—p. 119; and *Polar Voyage*—p. 205.

CANCER NUGAX.—*App. to Phipps's Voyage*—p. 192, pl. 12, fig. 3.

By reason of the small superadded setæ on the upper antennæ of the Cancer Nugax (*Phipps*), I have referred it to the genus *Gammarus*, although it does not participate in all the characters assigned to that genus by Latreille. The lower antennæ being longer than the upper, it belongs to Lamarck's genus *Talitrus*. This last character, together with the second pair of feet, being elongate, and terminated by a flattened setose articulation, without a claw, render the establishment of a new genus necessary for its proper arrangement.

It is a very numerous inhabitant of the Arctic Seas.

* Cuvier Règne Animal—vol. iv., p. 117.

10.—GAMMARUS AMPULLA.

GAMMARUS AMPULLA.—*Sab: Supp. to Parry's 1st Voyage*—p. ccxxix.

Ross, App. to Parry's Polar Voyage—p. 204.

CANCER AMPULLA.—*Phipps's Voyage, Appendix*—p. 192, pl. 12, fig. 2.

In this species the superior antennæ, which have also the superadded seta, are one-half shorter than the inferior; the second pair of feet are unguiculate, not setose, but the work is very minute. The fifth and sixth pairs have femoral laminæ, but less than those of the seventh pair.

It is by no means abundant in the Arctic Seas, excepting near the Low Island (of Phipps), Spitzbergen, where it was first discovered. Some few specimens were obtained near Felix Harbour.

11.—GAMMARUS BOREUS.

GAMMARUS BOREUS.—*Sab: Supp. to Parry's 1st Voyage*—p. ccxxix.

Ross, App. to Parry's 3d Voyage—p. 119; and *Polar Voyage*—p. 204.

SQUILLA PULEX.—*Degeer, Ins.*—vol. vii., p. 525, pl. 33, figs. 1 and 2.

G. caudæ dorso spinoso, oculis lunatis, pedibus quatuor anticis chelatis, pari septimo præcedentibus longiore. (Sabine.)

Is found abundantly along the shores of the north-east part of the American continent, and its contiguous islands, but especially so near the estuaries of rivers, seeming to prefer the brackish to the salt water of the ocean.

12.—GAMMARUS LORICATUS.

GAMMARUS LORICATUS.—*Sab: Supp. to Parry's 1st Voyage*—p. ccxxxi., pl. 1, fig. 7.

Ross, App. to Parry's 3d Voyage—p. 118; and *Polar Voyage*—p. 204.

G. rostro corniformi deflexo, dorso carinato, segmentis postice et acute productis. (Sabine.)

The specimens obtained in Prince Regent's Inlet agreed generally with Captain Sabine's description, but some few, taken at the same time, approached more nearly to Fabricius's* description of *Oniscus serratus*; the three posterior pairs of legs being much shorter than those of *G. loricatus*, but longer in proportion than those of *O. serratus*, when compared with the third and fourth pairs. In some specimens the rostrum was so very minute, as hardly to be distinguishable, whilst in others it was very large.

It is an abundant species.

13.—GAMMARUS SABINI.

GAMMARUS SABINI.—*Leach, Ross's Voyage*—oct. ed., vol. ii., p. 178.

Sab: Supp. to Parry's 1st Voyage—p. ccxxxii., pl. 1, figs. 8—11.

Ross, App. to Parry's 3d Voyage—p. 118; and *Polar Voyage*—p. 204.

G. segmentibus dorsalibus postice falcato productis, capite inter antennis acumine minuto. ;

This species was found abundantly in Prince Regent's Inlet, and near Felix Harbour.

* *Fauna Groenlandica*—p. 262.

14.—AMPHITHOE EDWARDSI.

TALITRUS EDWARDSI.—*Sab: Supp. to Parry's 1st Voyage*—p. ccxxxiii., pl. 2, figs. 1—4.

Ross, App. to Parry's 3d Voyage—p. 119; and *Polar Voyage*—p. 205.

T. (A.) rostro corniformi, antennis subæqualibus, corpore ovato depresso, caudâ compressâ tricarinatâ spinosâ.

The *Talitrus Edwardsi* of Sabine, belongs to the genus *Amphithoe* of Leach, which is adopted by Latreille. The excellent description and plate above referred to, render any further remark unnecessary.

It is an abundant species in the Arctic Seas, more especially near the island of Igloolik, where it was taken on a former voyage in very great numbers.

NOV. GEN.—ACANTHONOTUS. (*Owen, MS.*)

CHAR. GEN.—Antennæ subæquales, 4-articulatæ, articulo ultimo e plurimis segmentis efformato, articulo tertio superiorum brevissimo. Pedes 4-antici, monodactyli, filiformes, articulo ultimo primi paris serrato. Rostrum productum acutum, incurvatum. Oculi parvi.

15.—ACANTHONOTUS CRISTATUS.

CHAR. SP.—A. segmentis 4-anticis in crista continuâ superius elevatis; reliquis in spinis retrorsum inclinatis productis.

Acanthonotus cristatus, which forms the type of a new genus, closely allied to *Talitrus* of Latreille, was first discovered near the island of Igloolik, during Sir Edward Parry's second voyage; but as no account of the Marine Invertebrate Animals brought home, on that occasion was published, it has hitherto escaped unnoticed. In the course of our late voyage a few specimens, both of this and the following new genus, were obtained at Felix Harbour.

To the generic and specific characters given above we may add, that all the segments of the body are produced inferiorly into long spines, that of the fourth being the broadest and longest; of the dorsal spines, the fifth and sixth are the longer.

The *femora* of the three last pairs of legs are produced posteriorly into long spines, and the penultimate segment has two spines.

The first and second joints of the superior antennæ are terminated above by a spine; the third joint is the shortest.

The toe of the first foot is serrate, having about eight teeth, and the claw is clothed with fine hairs on the exterior surface, as represented, highly magnified, in fig. 10', plate B.

Plate B, fig. 8, represents a side view of *Acanthonotus cristatus* of the natural size.

Fig. 9, a magnified view of the upper part of the head and antennæ.

Figs. 10 and 11. Magnified view of the two first pairs of legs: and fig. 10' shows the peculiar formation of the toe and claw of the first pair.

Fig. 12. Magnified view of the three posterior segments, and middle plate of the tail; together with the lateral and terminal styliform processes.

NOV. GEN.—ACANTHOSOMA. (*Owen, MS.*)

CHAR. GEN.—Antennæ inæquales, superiores dimidio breviores, articulo ultimo e plurimis segmentis efformato, articulis tertiis et secundis superiorum æqualibus. Pedes 4-antici, monodactyli, filiformes, articulo ultimo primi paris unguiculato. Rostrum productum acutum undulatum. Oculi parvi.

16.—ACANTHOSOMA HYSTRIX.

CHAR. SPEC.—A. segmentis 9-anticis spinis septem armatis.

This very distinct genus is more common at Felix Harbour than the preceding; it was taken at Igloodik on a former voyage in considerable numbers.

On each of the first nine segments of the body there are seven spines, forming in the aggregate seven longitudinal rows, protecting the back and sides of the body; in addition to these there are two spines above the eyes, one on each side of the rostrum;

this part is white, curved over the head, and directed forward; the eyes are small and white. The tenth segment of the body has only five spines; the fourth and fifth caudal segments having three, and the others only two spines.

The *femora* of the three posterior pairs of legs are each armed with two strong spines posteriorly, of which those on the last are the largest and strongest. The two posterior caudal segments are each furnished with a double styliform process, of which the anterior is the longer. The middle plate of the tail is truncate, with two styliform processes, similar to those of the preceding genus.

Plate B, fig. 4, represents a large-sized specimen of the *Acanthosoma Hystrix*.

Figs. 5 and 6, a magnified view of the two anterior pairs of legs.

Fig. 7, the three posterior segments and middle plate of the tail, together with the lateral and terminal styliform processes.

MOLLUSCA — CEPHALOPODA.

NOV. GEN.—ROSSIA. (*Owen*.)

A single specimen of a small species of Cephalopoda was taken near the beach at Elwin Bay, Prince Regent's Inlet, on the 29th of August, 1832. It was preserved in spirits, and brought to England; and I am indebted to the friendship of Mr. Owen, Assistant Conservator of the Museum of the Royal College of Surgeons, for the following account of this remarkable animal, accompanied with illustrations of his dissections, which have been engraved by Mr. I. Curtis, F.L.S., &c.

J. C. R.

"The small Cephalopod which you have brought from the Arctic Regions to this country, proves to be the type of a new genus. It differs from *Loligo* and *Sepioteuthis* in the form, proportions, and position of its lateral fins, and in the extent of its horny dorsal style, or *gladius*;* in these respects, it bears a closer affinity to *Sepiola* (Leach); it differs, however, from *Sepiola* generically in having the anterior margin of the mantle free in the whole of its circumference; its natural position is therefore interme-

* This is the term by which Aristotle designates the horny plate of the Loligines:—"Τῇ μὲν οὖν σηπίῳ, καὶ τῇ τευθίδι καὶ τῷ τευθῶ ἐντός ἐσι τὰ σπερά ἐν τῷ πρανεῖ του σωματός, ἃ καλοῦσι τὸ μὲν σηπιον, τὸ δὲ ξιφος. Sub dorso firma pars sepiae loligini ac lolio continetur; illius sepium, horum gladium vocant.—*Hist. Animal.*, lib. iv., c. 1. 12mo. Ed. Schneider.

diate to *Sepiola* and *Sepioteuthis*, which it connects together as well by its intermediate size, as by the peculiarities of its structure.

I propose to call the genus *Rossia*, in honour of the Commander of an Expedition, at once so honourable to the enterprising character of the British seaman, and so interesting in its scientific results.

Class—CEPHALOPODA. (*Cuvier*.)

Order—DIBRANCHIATA.

Tribe—DECACERA.

Family—LOLIGINIDÆ.

Genus—ROSSIA.

CHAR. GEN.—*Corpus* ventricosum ; duabus pinnis latus rotundatis, subdorsalibus, antrorsum positis ; margine antico pallii libero.

Brachia subbrevia, triedra ; acetabulis pedunculatis, pedunculis brevissimis ; ad basin brachiorum in duabus seriebus alternantibus, ad apicem in plurimis seriebus aggregatis. Ordo longitudinis parium brachiorum, 1, 2, 4, 3.

Tentacula longitudine corpus æquantia, ad apicem acetabulis pedunculatis minimis obsita.

Gladius, corneus, longitudine lin. ix. æquans ; inferius parum dilatatus.

CHAR. SP.—*Rossia palpebrosa*.

From the obvious uncertainty of deducing a stable specific character from the only known representative of its genus, I have limited myself to proposing a *nomen triviale*, taken from the remarkable development of the skin surrounding the eyeball, by means of which this animal evidently possesses the power of defending the eye, as the pulmonated Vertebrata do by means of their more regularly-formed eyelids. The utility of this provision, in seas abounding with fragments of ice, is obvious. Fig. 1, pl. B, from a sketch by Captain Ross, shows the appearance of the eyes while the animal was alive ; fig. 2, pl. C, *h.* shows the closing of the eyelid after death.

The admeasurements of the specimen were as follow, but it must be borne in mind that it had shrunk in all its dimensions in consequence of having been macerated in spirit.

Inches. Lines.

Length from the end of the visceral sac to the end of the longest		
tentacle	5	0
Ditto from the end of the visceral sac to the anterior margin of the mantle	1	9

	Inches.	Lines.
Length from the end of the visceral sac to the interspace of the		
first or middle pair of dorsal brachia	3	2
Ditto of the tentacle	4	2
Breadth of the body (exclusive of the fins)	1	8
Ditto of the head, across the eyes	1	3

The specimen presented a dull dusky brown colour, over the whole of the dorsal and lateral aspects, and over the exterior of the arms. The pigment producing this hue was disposed in minute close-set points. Captain Ross's drawing of the recent animal exhibits a greenish metallic lustre, reflected from these surfaces, slight remains of which are still perceptible in the specimen. The ventral surface is of a light ash colour.

The form of the abdomen or visceral segment of the body is more ventricose than in *Sepiola*. The anterior margin of the mantle projects slightly forwards at the middle of its dorsal aspect, as in *Sepioteuthis*, and is reflected downwards for about half an inch before being continued upon the back part of the head. There is a transverse groove on either side of the mantle, about a line behind its anterior margin: this part is colourless anterior to the grooves, as in *Sepiola*.

The fins are short, semicircular, dorsal in their position, but nearer the sides of the body, and placed more forwards than in *Sepiola vulgaris*; the interspace between their origins is to the breadth of the body as 3 to 4, while in *Sepiola vulgaris* it is as 3 to 5. They project laterally from the body, with a slight inclination forwards. They measure in length one inch, in breadth ten lines.

The *brachia* are proportionately shorter and thicker than in *Sepiola*, more resembling those of *Sepia*, but not having the same relative dimensions as in that genus, e. g. the third, and not the fourth pair, is the longest (counting from the dorsal aspect), but the fourth pair is proportionately longer than in *Sepiola*. They measure,

The first pair, one inch.

The second pair, one inch three lines.

The third pair, one inch nine lines.

The fourth pair, one inch five lines.

They present the usual three-sided pyramidal form, with the internal facet beset with the suckers or acetabula. These are of a globular figure, supported by very short sub-lateral peduncles. Commencing from the base of the arms, the suckers are arranged in a double alternate series; this disposition prevails along the whole of the first pair, along

three-fourths of the second pair, and along about half of the third and fourth pairs of arms, beyond which the suckers are aggregated into irregular transverse rows of from three to five, diminishing in size to the apex of the arm. In this respect there is an intermediate structure between *Sepiolo*, in which the suckers are in a double alternate series along the whole arm; and *Sepia*, in which they are aggregated from the commencement. The horny cup in each acetabulum has its margins entire: and its diameter is equal to one-third of the fleshy sphere in which it is implanted.

The tentacles or proboscides* are round, and slightly dilated at their extremities, which are beset for about nine lines by minute and close-set suckers; these diminish in size towards the extremity of the tentacle, and the largest of them do not exceed one-fiftieth of an inch in diameter. The horny cup of these acetabula is proportionately larger than in those of the brachia, and their pedicles are longer. (See *b*, pl. C.) A narrow membranous expansion is extended along the sides of the dilated extremities of the tentacle.

The tentacula emerge from within the membrane extended between the third and fourth pairs of brachia, but this interbrachial fold, though of greater breadth, does not connect the arms together for a greater extent than the membrane between the third and second, or that between the second and first pairs of legs; but there is no corresponding fold between the ventral pair of arms. In this respect *Rossia* resembles *Sepiolo* and *Sepia*; in all of which, therefore, the interbrachial membranes have obviously other uses than to protect the tentacles, which can be retracted into a cavity below the base of the arms; they probably serve, but in a minor degree than in *Octopus*, as a repulsive fin.

The eyes of the specimen were of large size, forming the usual convexity on each side of the head; they were, however, as has been before mentioned, almost completely hidden from view by the contraction of the lower eyelid principally, the opening of the fold corresponding to the transparent portion of the integument continued over the eyeball (for the animal cannot be said to possess a true cornea), was of a longitudinal figure, and dorsal in its position. In *Sepiolo* there is a slight fold beneath the eye, corresponding to the largely developed eyelid in *Rossia*, but there is a greater proportionate breadth of the head at this part in *Sepiolo*.

The siphon or funnel extends to within a line of the interbrachial membrane of the ventral pair of arms, resembling in this respect *Sepiolo* rather than *Sepia*, or *Sepio-teuthis*, where the funnel reaches only half-way between that part and the margin of

* This superadded pair of elongated arms were termed by Aristotle *προβοσκιδαί*, in contradistinction to the ordinary eight arms, which he calls *πόδες*.—*Hist. Animal*, lib. iv., c. 1.

the mantle. It is depressed and tapers towards the extremity; within the tube, and two lines distant from the end, there is the small valve, which exists in all the Cephalopods that have locomotive organs adapted for propelling them forwards. On either side of the base of the funnel there is an oblong cartilaginous depression, surrounded by a raised margin, to which a corresponding projection on the inner side of the mantle is adapted. This structure for strengthening the attachment between the mantle and the head is met with in all the *Decacera*, and in *Ocythoë*, but does not exist in *Octopus*. The membranous expansions from the sides of the base of the funnel, corresponding to the 'callottes' in *Octopus*, extend in *Rossia* around the anal aperture.

The rudimentary dorsal shell, or gladius, is not more than nine lines in length, and one line and a half in breadth at its lower and dilated half; there is a longitudinal mesial ridge on its external surface, and a corresponding groove with lateral ridges on the opposite side; it is of a firm texture, and brown colour anteriorly, but becomes thin, soft, white, and cartilaginous at its posterior extremity.

The digestive organs of *Rossia* resemble those of *Sepiola*, with the exception of the laminated pancreatic cæcum being of a simpler form, and the follicles appended to the biliary ducts being more developed; these are larger, indeed, than in any Cephalopod in which this structure has been found. The horny mandibles, and their surrounding fleshy lips, present no peculiarity worthy of remark. The outer lip, as in *Sepiola*, is more contracted than in *Sepia*. The œsophagus descends in the dorsal interspace of the hepatic lobes without dilating to form a crop. The muscular stomach is lined with a cuticle, but is not so strong as in *Octopus*. The laminated cæcum is a simple oval cavity, as in *Nautilus*, without spiral appendage. The biliary secretion enters it between two of the widest laminae, which are continued onwards some way into the intestine. The gut ascends without any convolution on the opposite side of the liver, and terminates between the two muscles which connect the base of the funnel with the ventral side of the mantle, and which, from their disposition, serve as a sphincter to the intestine.

The lower pair of salivary glands are lobulated, and of the usual proportionate size. The liver is bilobed, each lobe notched at its upper end, and expanding towards the lower end. Besides the proper capsule, which has a smooth glistening surface, the liver is contained in a strong peritoneal cavity. The two biliary ducts emerge from the lower end and immediately branch out into a mass of larger and simpler follicles, which are arborescent, and extend their ramifications half an inch from the ducts, forming a mass, which conceals the upper halves of both the stomach and rudimentary pancreas. The ink-bag is situated between the liver and the muscles which surround the arms, close to which its duct enters the intestine. The ink is black, of the same tint as the china-ink.

The organs of circulation, in the form of the systemic ventricle and of the spongy *venæ cavæ*, resemble those of *Sepioteuthis* more than those of *Sepiola*; the branchial ventricles are proportionately larger than in any other Cephalopod. The *vena cava*, after its division, becomes dilated and cellular, but the cells are not produced outwardly into distinct pendulous follicles, the exterior of the vein presents simply a folded or convoluted appearance. The branchial ventricles are of a transversely oblong figure, four lines in length, and three in breadth: they have the small fleshy appendages, as in *Sepiolu*, *Sepoteuthis*, and other true decapods. The fleshy stem of the branchia, through which the branchial artery passes is very broad. The branchial vein dilates into a sinus or auricle, before terminating in the systemic ventricle. This is of a cylindrical form, tapering at its lateral extremities where the blood enters, and bent upwards at the right side to give off the greater aorta; the lesser aorta comes off from the middle of the opposite side of the ventricle.

The larger aorta ascends with the œsophagus between the lobes of the liver, the smaller one descends to supply the ovary principally. The specimen was a female, and had been taken at the season of reproduction. The ovary occupied the lower half of the dorsal aspect of the abdomen; it was filled with numerous bodies, varying in size from one line to six in the transverse diameter, and with as various figures, some being spherical, others oval, some pyriform, and a few rendered angular by external pressure, but all having their superficies more or less reticulated, as in *Sepia*, &c., in consequence of the honeycombed glandular structure of their parietes. These bodies, which are appended by delicate peduncles, of various length, to one point of the membranous ovary, are commonly regarded as the ova,* but they are, in fact, the glandular calyces, which secrete the true ova; the analogous parts in the *Nautilus* I have termed *capsulæ oviferæ*: they correspond to the Graafian follicles or ovisacs of the Vertebrata. The ova in these ovisacs exhibited in *Rossia* various stages of development indicative of an internal impregnation: many of the reticulate ovisacs were collapsed, having discharged their ova; nine of the ova so discharged, were situated in the single oviduct. The ova which still remained within the capsules had the smooth transparent cortical membrane perfectly formed, and differed from the ova in the oviduct only in the tenuity of this membrane. The discharged ova measured five lines in the long and four in the short diameters. The oviduct was wide, thin, and membranous; it passed along the ventral aspect of the ovary and pericardium towards the left side: its termination was thickened, and beset with transverse glandular folds, as in *Nautilus*, and was situated immediately behind the two large superadded

* See Grant on the Anatomy of *Sepiola*, in Zool. Trans.—vol. i., p. 84, pl. 11, fig. 12.

glands. These bodies have been described in *Sepiola*,* as the oviducts, but they are equally distinct from the true efferent tube in that genus as in *Rossia*; the true oviduct being single in *Sepiola*, as in *Sepia*, and forming by its termination the crescentic glandular organ, which lies between and behind the two large accessory glands above mentioned; of which the function is to secrete the adhesive substance which connects the ova, after they have passed out of the oviduct, and before they are discharged by the funnel. Filamentary processes of the secretion were hanging from the ducts of the glands in the specimen here described. They are composed of numerous transverse laminae, the secretion of which passes into a central longitudinal fissure, where it is moulded into the filamentary form. In *Nautilus* these glands are united at the mesial plane, and the corresponding organ is single in the pectinibranchiate mollusks.

EXPLANATION OF THE FIGURES.

Plate B.

Fig. 1. *Rossia palpebrosa*, from the dorsal aspect.

Plate C.

Fig. 1. *Rossia palpebrosa*, with the mantle and funnel laid open on the ventral aspect, showing the infundibular valve, the ova in the oviduct, and other viscera *in situ*.

Fig. 2. The same laid open on the dorsal aspect, and the capsule of the liver removed, showing the ovisacs, and the relative position of the viscera on this side of the abdomen.

Fig. 3. The digestive canal laid open.

Fig. 4. The branchia, and organs of circulation.

The same letters indicate the same parts in each figure:—*a*, the eight brachia; *a'*, one of the brachial suckers magnified; *b*, the two tentacula; *b'*, a tentacular sucker magnified; *c*, the fins; *d*, the inside of the mantle; *e e*, the processes which enter *f f*, the cavities at the base of the funnel; *g*, the infundibular valve; *h*, the opening of the eyelids; *i*, the œsophagus; *k*, the muscular stomach; *l*, the pancreas; *m*, the intestine; *n*, the anus; *o*, lower salivary glands; *p p*, liver; *p' p'*, hepatic ducts; *q*, hepatic follicles; *r*, ink-bag; *s*, vena cava; *s' s'*, its glandular auricular portions going to *t t*, the branchial ventricles; *v v*, their fleshy appendages; *w w*, the branchiæ;

* See Grant on the Anatomy of *Sepiola*, in Zool. Trans.—vol. i., p. 84, pl. 11, fig. 10.

x x, systemic sinuses; *y*, systemic ventricle; *z*, aortæ; 1 1, ovisacs in the ovary appended to filamentary pedicles; 2 2, ova in the oviduct; 3 3, glands which secrete the *nidamentum*, or connecting substance of the ova.

ARGONAUTA ARCTICA.—*Fab: Faun. Grænl.*—p. 386.

A very abundant species; peopling as it were the Polar Seas, and constituting the chief source of subsistence to the Greenland whale. It is indeed most truly wonderful that so small and apparently insignificant an animal can be made to fulfil the most important purposes; from the smallest species of crustacea to the enormous whale, all derive their food directly or indirectly from this little creature. It is in fact

to the inhabitants of the Arctic Ocean, what the vegetable kingdom is to the inhabitants of the land—the foundation of animal existence.

ACEPHALA.

4.—BOLTENIA RENIFORMIS.

BOLTENIA RENIFORMIS.—*Mac Leay, Trans. Linn. Soc.*—vol. xiv., p. 536, pl. 18.

ASCIDIA GLOBIFERA.—*Sub: Supp. to Parry's 1st Voyage*—

ASCIDIA CLAVATA.—*Fab: Faun. Grænl.*—p. 303.

CHAR. SP.—B. obscura scabriuscula, corpore subreniformi, orificiis subprominentibus, pedunculo terminali. (*Mac Leay.*)

A single specimen of this extraordinary animal was dredged up from a depth of seventy fathoms, near Elizabeth Harbour. I can add nothing to Mr. Mac Leay's admirable description, except that the colour of the body is a very light brown, that of the pedicle darker.

5.—CYSTINGIA GRIFFITHSII.

CYSTINGIA GRIFFITHSII.—*Mac Leay, Trans. Linn. Soc.*—vol. xiv., p. 540, pl. 19.

C. ovata globosa cineracea glabra semipellucida, pedunculo vix longitudine corporis. (*Mac Leay.*)

This interesting species is of very rare occurrence, even in those seas where it was first discovered; a single specimen, taken in Fox's Channel, during Sir Edward Parry's third voyage to the Arctic Regions, fortunately for science came under the notice of Mr. Mac Leay, and, together with two other species of *Ascidia* from the same place, was the occasion of his learned memoir on the "Anatomy of the Natural Group of *Tunicata*," *loc. cit.*

Two specimens were obtained by us near Felix Harbour, but as these were abandoned with the rest of our collection, it is probable that the individual from which Mr. Mac Leay's description and drawings were taken, is the only specimen ever brought to England.

GEOLOGY.

BY CAPTAIN SIR JOHN ROSS, *C.B., K.S.A., K.C.S., &c.*

GEOLOGICAL NOTICE RESPECTING THAT PART OF THE AMERICAN LAND VISITED DURING OUR VOYAGE.

I MAY commence with James's Island, of which Sir E. Parry examined the southern and eastern coasts; my observations which are peculiarly scanty for this part of our voyage, are limited to the northern shore, to which the name of North Devon has been given. I must at the same time say, that under my previous familiarity with the neighbouring and opposed shore of America, I formed the conclusions here drawn, more from a comparison of the physiognomy of the little known with that which had been far better studied, than from observations which our very brief intimacy with this coast afforded me no means of making.

My acquaintance with the shore in question begins at Cape York, and extends to Possession Bay. The whole of this line presented that succession of limestone, which from its similarity, in every particular, of picturesque forms, positions, and mineral characters, I had determined, when on the American shore, and with ample opportunities of examination, to be a "deposit" or "series," so resembling that which the geologists of England term mountain limestone, that it must be discriminated by this name, unless, as I do not yet know, the American philosophers have applied another term to their great calcareous formations.

Of the interior country on this shore, I must speak with more reserve; yet drawing such inferences as I here give, from the same source, namely, the exceeding similarity

of character in the forms of the land on the two sides of the passage which includes Barrow's Strait and Prince Regent's Inlet. It will immediately be seen, that on the American shore, the limestone skirts the bases of chains of hills which consist chiefly, or, to our observation at least, most conspicuously of granite, including some portions of the primary stratified rocks, which might have been more extensive than I had the means of ascertaining. Now, the same exact character of outline and general aspect pervaded the interior of James's Island, as far as that was visible; where a range of mountains possessing the same conical irregular forms as those on the American shore, rose at the back of the assignable limestone hills. I could not but conclude that their geological nature was the same; while some specimens of gneiss, of green compact felspar, and of granite, picked up on the beaches where our boats landed, served to confirm this conclusion: and the more so, from their absolute identity with the analogous rocks which I had collected along the shore from Fury Beach to the isthmus of Boothia.

If I have thus referred to my first and far more detailed observations on the geological structure of the American shore, I may commence at Cape Northeast, being the north-eastern part of America, sufficiently noted in the chart appended to this work.

At this place, the forms of the land alone might, to a practised eye, have disclosed the nature of the fundamental rocks; since the hills present those outlines, so well known, by which this limestone is characterized; the stratification equally indicating the mineral constitutions of the rock, in those cliffs and ravines, where it is peculiarly exposed; as the examination of specimens at more leisure, with the long continued contact which I could command throughout a space of many miles, could leave no doubt of the truth of these conclusions, from the point in question, as far as Fury Beach.

I must now observe, that from Northeast Cape onwards to Adelaide Bay, I could obtain no sight of any interior hills, of the same conical and irregular character as I had become so well acquainted with on the more southern parts of this shore. Every visible hill was flat-topped, so as to convince me that it was a part of the same calcareous range. But at the bottom of Cresswell Bay, I first began to see a range of interior hills, of a very different character: and subsequent observation, accompanied by a long experience of the nature of the rocks, which I could examine at hand, having taught me that the hills of this character consisted of primary rocks, and far most extensively, of granite, it is at this point that I must first note my assurance of the existence of a range of granitic and its associated rocks, on this coast; forming the fundamental structure of this country, and covered, or rather skirted, as is usual, by a range of the secondary, and, for the most part, calcareous series.

As well as I could estimate, the distance of this primary interior range of mountains, from the sea-shore, judging at least by that of their summits, is about thirty miles. But from that, somewhat indeterminate point, of course, the ridge, if ridge it be, which appears so to the eye, inclines towards the sea line, and, in its progress thence, reaches the shore at Port Logan. The limestone which I have already mentioned, disappears in consequence, and I met with it no more on this eastern coast; recovering it only to the westward of the isthmus of Boothia, near Neitchillee.

I must now, therefore, note as much of its peculiarities as may enable geologists to form that judgment of its analogy to the rocks they have defined on which I have no right to decide, from my very imperfect acquaintance with this subject. I presume, of course, that they will call it "the mountain limestone," because this is the name which I have seen applied to rocks resembling it in character, and, as far as I understand those subjects, in position: but this however I must leave to the more competent.

From Northeast Cape to Adelaide Bay, it presents those forms which distinguish the limestone district of Yorkshire, but with far more decided shapes in some parts of this line, of which the analogies and resemblances may be seen in Derbyshire, though in the most remarkable places, these are very like to some scenery which I remember seeing in a French picturesque work, representing the scenery and antiquities of Pola, in Istria.

It would be to repeat what must be well known to every one interested in this subject, to say, that the fractures which the precipices of this rock present, are frequently such as to display the appearance of castles and towers, as the smaller ones are apt to exhibit the appearances of niches and statues, so as to confer on them a singular and striking variety of architectural effect, which, under peculiar circumstances, is even very deceptive. Of these apings of the works of art, we had an abundant and various display; that I could not make pictures of what I saw, from the extreme severity of the weather, and the difficult circumstances in which I was almost invariably placed, might possibly be regretted on the score of art, but can be of no moment for the present end, where the general fact and its bearings are so well understood by all whom geology can interest.

If this leading and striking character is not sufficient to satisfy geologists respecting the precise nature of this limestone, as it regards the systems of the earth which they have adopted, I suppose that this presumed character will be confirmed by its mineral nature, and by that of the organic remains which it contains. In different places, the former exhibits all those various characters, in texture and colour, which I have seen in collections of specimens of this particular limestone, as well as in several parts of Scot-

land, where this rock has been pointed out to me, though it would be superfluous for me to describe what is well known to every geologist. And if sometimes pure and somewhat marble-like in its texture, so it is argillaceous and dull, when it approaches to those shales into which it gradually passes, and with which it is interstratified.

It is in its shales also, as I understand is usual with all limestones, that the organic remains which it contains are chiefly found; though, as is not uncommon elsewhere, some of these occur only in that compact and almost pure calcareous rock, of which they form a part. If, even, I were better informed on this subject, so as to know the distinctions of rocks which are derivable from shells, I could not pretend to distinguish fragments, nor even the more perfect shells, by their present names in the modern systems; since I have had no means of keeping my knowledge up to the level of the improvements in this branch of science. Suffice it to say, that such organic remains, or shells, as I found, consisted of corals, of entrochi, of terebratulæ, and of others which I will not, or need not, pretend to name; as of all I may say, that they bore such a general resemblance to those of the "mountain limestone" of England and Scotland, which I have seen in collections, as will doubtless satisfy others respecting that in which I am not inclined to take any further concern than may be necessary for allowing others to form those conclusions, which it would be presumptuous in me to draw.

To terminate the history of this limestone, I need only remark in addition, that after ceasing at Port Logan, where the primary rocks reach the shore, it recurs at Neitchillee, to the southward of the isthmus of Boothia, and that it was thence traced for about two hundred miles to the westward, towards Cape Franklin, where our knowledge of this coast ends. On this long line, however, no mountains of this rock, such as I have described as occupying so great a range of country, occurred. In general, the shores were barely skirted by low strata of a calcareous stone, frequently schistose, intermixed with shales; as they were often so encumbered with fragments and blocks of the primary rocks, as well as of the limestone in question, that I could not often be sure that the fundamental strata were present. The geological conclusion that I was compelled to draw was, nevertheless, the same; namely, that the primary district of this portion of the American coast was skirted throughout its whole extent, with the exception of that line on which the sea met those rocks, by a series of secondary strata, of which this peculiar limestone was the leading and almost the exclusive member.

I ought now, according to the usual doctrines of geology, as I understand them, to have also found the red sandstone, which holds a place between this limestone and the primary strata. I must, however, observe, that on the whole of the long line which I examined at various times, extending from Northeast Cape to the Western Sea, that

rock was never found in its position: whether owing to its real absence, or to the difficulty of seeing shores so often, and for such long periods, covered with ice and snow, or to my own negligence of this subject, where there was so much of more importance to engage my attention, I cannot now presume to say. Several fragments of a sandstone were however picked up on the shores, at various and distant places; as, for example, near Batty Bay, at Fury Beach, at Victoria Harbour and at other places which I need not name, proving the existence of sandstone strata in the vicinity, or at least somewhere on this coast.

But according to more practised judgments than my own, these specimens are inadequate to prove whether the rock whence they have been derived belongs to the lowest red sandstone, or to that which is termed red marl. That they are red, brown, and mottled, sometimes soft, and at others very hard, is all that I can say respecting them; and this diversity of character is, as I am informed, well known to occur in both the sandstones in question.

But there is one fact whence I am told I may conclude, that in some parts of this shore, at least, the collected specimens must have been derived from the red marl, whatever may be the case with respect to the southern part of the same line. This is the occurrence of gypsum in the vicinity of Northeast Cape: a mineral which geologists have hitherto referred to this series. But I must leave that matter to their judgments, as I have nothing more to suggest on the subject of these rocks, since I am not possessed of any other evidence than that which I have stated. It is only needful to add, that as I saw no strata superior to the limestone, and obtained no specimens likely to have been derived from any series higher than the red marl, as the several friends whom I have consulted admit; so I may, I presume, conclude that the secondary strata of this shore are limited to the rocks which I have described: a fact which, if I have read sufficiently on this subject, is exactly conformable to what occurs very widely in the northern portion of the North American continent.

Having already said of the primary land of this coast, that it forms ridges of hills more interior than those of limestone wherever these occur, I must now observe that it reaches the shore at Port Logan, and occupies the remainder of that coast to the southward, together with the valley of lakes that crosses the isthmus, as far as Lake Wittersted, where it is once more skirted by the flat limestone already described. Of the geography of this class of rocks, I can, of course, give no further description, since the climate and the snow united, prevented all research into the interior, and all minute examination, for the most part, of what was accessible.

To say that what I saw and could not touch, consisted of granite, is more than, as I am told, I ought to affirm, since geologists seem agreed that it is difficult to judge of

primary mountains by their physiognomy alone. Even when more near the eye, I will not say how often I may not have mistaken gneiss for granite; yet this latter rock seemed to me to predominate through all the ridges, as it was also that which I found far most frequently whenever I could obtain actual contact with the rocks.

That it presented the usual variety of external character, I need scarcely say, and that it included a great variety of mineral aspect or composition is what I can now but remember, without being able to describe. Only three varieties appear among the very few specimens which I brought home; namely, one of red felspar, white quartz, and hornblende, one of the same felspar and quartz, with white mica, and a third of pale felspar and quartz, with a dark variety of this mineral. In one place I noted that a large mass of this rock was thickly studded with garnets; but having brought home no specimens, I cannot now describe it more particularly.

Having found no specimens of gneiss in this small rescued collection, and having but little recollection of the places where I saw this rock, I can give no account of it. Commander Ross appears to have met with it more extensively than I did, but as this branch of natural history was not under his charge, I cannot derive from his recollection, any facts sufficiently positive to state, either respecting its geography or its mineral characters. I shall only note, that in Felix Harbour, I found hornblende schist, belonging to this series, as I am informed, together with that compact green felspar, which is known to be one of its inmates. That I saw common slate, or argillaceous schistus, in Victoria Harbour, and in one or two other places, is all that I can now recollect respecting that rock; while one of the engraved plates represents a part of a stratum associated with another of gneiss, traversed, as it appears, by a granite vein, and the whole intersected by one of quartz.

The last rock which I have to notice is trap. A considerable mass of this occurs at Saumarez River, and it is also represented in one of the plates; the only other place where I noticed it was near Elizabeth Harbour, where numerous veins traverse the granitic hills which skirt this shore.

Of mere minerals, I found agate pebbles in one place, with veins of white, pink, and yellow quartz, near Elizabeth Harbour, and copper ore near Agnew River and Lord Lindsay River.

The hills are often covered with granite boulders, offering the usual difficulty so often discussed: but I saw no other alluvia than those which are easily referred to the flowing of water during the summer thaws, and to the action of the waves on the shores.

REPORT ON INSTRUMENTS.

My transit instrument was made by Mr. T. Jones, of Charing Cross, for my observatory at North-west Castle, Wigtonshire, where I had it in use four years. Its telescope was thirty-six inches in length, with an object-glass two inches and five-eighths aperture, and was an excellent instrument: it was the whole time under the charge of Commander Ross.

My theodolite was nine inches in diameter, with double telescope, and was made also by Jones, for the late Captain Bartholomew.

The diurnal variation instrument was made by Mr. Dollond, whose instructions I received respecting its use, and was the same which had been made for Sir John Franklin. I had also two altitude instruments made by Jones, which were supplied to me from the Colonial Office, and which I used to determine the height of the Eastern over the Western Sea. I had three dipping-needles, one made by Jones, which was with Sir Edward Parry; one by Pope, and one of my own construction. We had five sextants; an instrument sent by Mr. Warre, which was the invention of Lieut. Drummond, R.A., being a compass with apparatus for finding the latitude and longitude attached to it, and was a very ingenious invention; but, as the compass had ceased to traverse where we wintered, it could not be tried. My telescope for occultations was sixty-six inches focal length, with an aperture of three inches and five-eighths; the object-glass by Tully. I had also Barlow's apparatus, and Gilbert's azimuth compass, and six others; two marine and one mountain barometer. Rowland's and Tyrrel's perspective instruments, the former was found of great value as

the greatest tyro in drawing could not fail to delineate the land correctly with it. The deep sea clamms, Dr. Marcet's water-bottle, Massey's patent log, and other instruments of minor importance, were, with the exception of Jones's dipping-needle, two sextants, and two spyglasses, left at Victoria harbour, where they were buried on the north side of the bay; but I have no doubt but they would be discovered and destroyed by the natives.

TERRESTRIAL REFRACTION.

THOSE who pass a year northward of the Arctic Circle, during the spring and autumn, are amazed at the extraordinary appearance of the objects around them, which are often changed in shape so totally different from what they really are, that it is quite impossible to take correct sketches, or make any thing like a true estimate of the distance of the land, which, in the course of a few minutes, is often so much changed as not to have any thing like the natural or true outline. Captain Scoresby gives some extraordinary instances of both land and ships seen at an immense distance, and on our first voyage it is recorded, that Cape Clarence was seen from the deck at the distance of one hundred and twenty miles, the ship being at that time two degrees of latitude south of the cape; and, indeed, it was only in the spring after our arrival at Felix harbour, that we discovered the land to the east-south-east of us, with many intervening islands. But the most remarkable circumstance which occurred during our observations was the uneven current of refraction raising an intermediate body (an iceberg or island) above the more distant land, which at the time of no refraction was considerably higher. This fact at once shows the fallacy of setting up a mark or board at a distance of a few miles to observe a star setting behind it; and which could be no proof of the inaccuracy of the table of refractions in the Nautical Almanac, which, indeed, I found by all my observations to be wonderfully correct. I cannot omit to mention an extraordinary instance of unusual refraction, which took place on the 22d of September, 1832, when we were at North End Cape, lat. $73^{\circ} 53'$ north, long. 90° west. The weather was very clear, and, in an east-north-east bearing, no land could be seen

I was watching the rising of the sun, with my eyes fixed to the spot, when I saw the sun emerge; in an instant his lower limb was his full diameter above the horizon, without his figure being changed; in this position he remained about half a minute, then fell, his lower limb being dipped about one-eighth of the diameter; he then assumed various amorphous forms, continued varying for five minutes, and at length assumed the proper form.

The plate is given to show the land in three different states:

First, as with no refraction, distant fourteen miles.

The second is the same land, with an iceberg four miles distant raised above the land.

The third, the same refracted in a different way on the same day.

These outlines are taken by Ronald's invaluable instruments which I had fixed on a point of land sixteen feet above the level of the sea, and by which the figure could be traced with the greatest precision, and with which I made above three hundred observations, tending to confirm what I have stated. These observations were taken during the first week in May, 1831.

ANALYSIS OF FLUIDS, &c.

I AM indebted for the following article to my friend Mr. Thomas Rymer Jones, who, in conjunction with Mr. Hemmings, submitted the articles I gave them to a careful examination, and made the following report, which requires no comment, as the acquirements of these gentlemen are known to qualify them highly for such an investigation.

1.—SEA-WATER FROM PADLIAK OR SPENCE BAY.

This water was taken from the sea by me on the 4th of June, 1830, and carefully preserved in a bottle with a ground glass stopper, and was never out of my possession, having been carried by me the whole length of our fatiguing journey to Fury beach; in order to establish the specific gravity and component parts of the water in the sea of King William, or that to the westward of the isthmus of Boothia.

The specific gravity of this water was 1.011 at a temperature of sixty-four degrees of Fahrenheit, and a wine pint contains 116,97 grains, of which matter—viz.:

	GRAINS.
Magnesia . . .	5.81
Chloride of sodium	92.5
Sulphate of lime .	7.67
Sulphuric acid .	4.39—besides that contained in the sulphate of lime.
Muriatic acid .	5.65—besides that contained in the muriate of soda.

The salts therefore contained in the water are most probably—

	GRAINS.
Muriate of magnesia	8.7
Sulphate of magnesia	8.26
Chloride of sodium (dry salt) . .	9.25
Sulphate of lime	7.47

116.93

2.—BRINE FROM FURY BEACH.

Having found this fluid in a beef-cask at Fury beach on our return to winter there, and still in a fluid state while the temperature was below zero, I made use of it as an artificial horizon; and as it was subsequently exposed to a temperature of forty degrees below zero (at which point the finest mercury freezes) without being frozen, I thought it worth while to preserve some for analysis, and the following is Mr. Jones's report:

The specific gravity of this brine was 1.171 at a temperature of sixty-four degrees of Fahrenheit. Two fluid drachms contained thirty-one grains and a quarter of solid matter, of which twenty-eight grains were pure chloride of sodium, the remainder contained traces of sulphates of magnesia and lime, and a small quantity of animal matter; a portion placed in a thin glass tube was submitted in succession to the action of some of the most powerful freezing mixtures without undergoing congelation.

3.—WATER FROM THE RIVER SAUMAREZ.

This river, which is in the latitude of seventy degrees north, was found flowing and unfrozen by us early in May, 1830, and, according to the account of the natives, never freezes. As the cause of this phenomenon was unexplained, and might be attributed to the nature of the water, I took some carefully out of the river and found its temperature then at thirty-three degrees of Fahrenheit; since which it was, like that of the western sea, never out of my possession, but kept in a bottle with a ground glass stopper, and carried by me from the time the Victory was abandoned until our return, when it was handed to Mr. Jones, and the following is his report:

Specific gravity of the water from this river is 1.004 at sixty-four degrees of Fahrenheit. This was found to contain a minute portion of the chloride of sodium, and traces of the sulphate of lime.

From this it must appear that the nature or component parts of the water could not be the reason that it did not freeze, and it must therefore be attributed to ~~springs~~ in the bottom of the Great Lake, out of which it flows, and which we estimated to be about three hundred feet above the level of the sea. This chain of lakes was about fifteen miles long, and in some places, three miles wide.

4.—WINE FROM FURY BEACH.

This wine had been lying four years in cask on the beach before we arrived, when we took it on board, and bottled it, after which it was four years in my possession.

Sherry—specific gravity 0.991 at temperature 64 degrees of Fahrenheit.

Port wine—ditto ditto 0.981 ditto ditto.

5.—RUM FROM FURY BEACH.

This is under the same circumstances as the last.

Specific gravity 0.910.

These articles had undergone no change, except, probably, a diminution of strength sufficiently indicated by the specific gravity. The same may be also said of a bottle of brandy cherries which were brought home, *without being opened*, the fruit not having been in the least decomposed. In addition to this, I may mention a bottle of the cordial called “Parfaite Amour,” which, although exposed to the severest test, had lost neither colour nor flavour.

6.—LEMON JUICE.

This had been exposed in casks for eight years in Fury beach, and we were of opinion that it had lost much of its antiscorbutic qualities, from its want of the expected effect on those who were afflicted with scurvy; and our opinions seem to have been well founded, according to the following report:

The lemon juice has undergone a partial decomposition, but still contains a considerable

proportion of citric acid; the decomposition being principally in the *vegetable* matter, seems to imply that citric acid alone is not a check to that dreadful malady the scurvy.

7.—THE MUSTARD

Had, as might be expected, lost the greater part of its pungency.

STATE OF PROVISIONS.

The provisions of which the following account is given, had been lying exposed to the climate for eight years, in the latitude of seventy-three degrees and forty-seven minutes north, and longitude of ninety-one degrees and forty-seven minutes west, and very little above high-water mark.

The preserved meats, with few exceptions, were the manufacture of Messrs. Gamble and Co., and being enclosed in tin cases, could not be discovered by animals who depend on the sense of smelling: these were cylinders of various sizes, the ends of each becoming concave or convex, according to the degrees of contraction or expansion caused by the climate, secured them against bursting from its effects, and the contents were found to be in nearly the original state: these consisted of beef, roasted and boiled, veal, mutton, spiced meat of various kinds, turnips, parsnips, and carrots, all of which were found to be in excellent preservation. The soups, which were preserved in quantities, from a quart to a gallon, were excellent, and we left a considerable quantity behind, but no meat of any kind.

The flour, which was preserved in iron-bound casks, and had been likewise exposed for eight years to the climate, was found to be in good condition; for although in many cases the hoops had slackened, so as to admit the moisture into the cask, it penetrated but a short way, while the whole of the interior was perfectly sound. The bread, of which there were many casks, was in a good or bad state, according to the soundness of the cask which contained it, and we employed ourselves in separating the bad from the good, and put all into repaired casks. A part of this, and also of the flour, is sufficient, with the addition of the remaining soup, to sustain the life of twelve men for a year. Owing to the pickles being also in cask, they had suffered much, the vinegar having leaked out of most of them: fifty of these, and twenty-five of lemon juice, are also left, at a little distance south of the house, and covered with coals, as the most effectual way of preserving both.

PHILOSOPHICAL OBSERVATIONS.

ON COLD.

HAVING already devoted much in Chapter XIII. of the Narrative on this subject, as it regards the human body, it only remains to publish my experiments on its effect on other substances. I shall begin with those on ice, which were repeated yearly : the thickness of the ice was measured regularly, both on a lake and in the sea, every month, and was found to increase until the end of May, when it had arrived at its maximum thickness, which in the sea was ten feet, and the lake eleven ; the proportion being so much more on fresh than on salt water. In the months of February and March, when the temperature of the air was at fifty degrees below zero, the temperature of the ice gradually diminished between the surface and the water, which was, immediately below the ice, at the temperature of twenty-seven degrees ; showing that to freeze sea-water below the ice (where no air was to be found) required a temperature five degrees lower than the freezing point of Fahrenheit. This was done by excavating a large shaft in the ice, and, as it deepened, a horizontal hole was bored large enough to admit the thermometer at every foot in depth, until we arrived at the water, in which a thermometer was immediately immersed, and the result obtained, the further detail of which need not be presented.

ITS EFFECTS ON SNOW.

The same experiments were made on snow, with proportional results ; twelve feet depth of snow being equal in the resistance of cold to seven feet of ice. It was from these experiments that I determined on covering our miserable canvas habitation at Fury beach with ice, which was accomplished by watering the snow walls as they were constructed, and also the roof ; the former being made from seven to nine feet thick, and the latter from four to six. This we found effectual against cold until the mercury had

frozen ; after which, the frost penetrated more or less according to the force of the wind. The general effects of the cold on the snow as it fell, was to pulverize it, so that when a strong breeze came it rose and filled the air like dust, to a considerable height. On the other hand, the valleys, and every place into which the wind had forced the snow, became so hard as to bear being formed into blocks, like Ashlar work, of large dimensions, and rolled into the sledges without damage, and thus we were enabled to build the walls of our huts with considerable rapidity, our first care on halting being to find a place where the snow was hard.

ITS EFFECTS ON MERCURY.

The effect of cold on mercury depended materially on its purity, and I observed that the longer or the oftener it was used, it froze the sooner. It was at first imagined that the lead of the trough which is generally used in artificial horizons, amalgamated with the mercury, but I always used a wooden trough, and a glass bottle to keep it in ; notwithstanding which the scum, which was always greatest in cold weather, was equally large, and every year the mercury which had been used, froze at a higher temperature, until it reached to thirty-one degrees, being eight degrees higher than the usual point ; while mercury, which had not been exposed, retained its purity. We went through the usual experiments of freezing it in a pistol-bullet mould, and firing the ball through an inch board ; as also the finest almond oil, which froze at fifteen degrees, and became very hard at thirty degrees, so as to penetrate, when formed into a bullet, through an inch plank at the distance of five yards.

The effect of cold on various metals was found to be the same as has been often published ; but perhaps the loss of magnetic power, in no less than twelve needles of compass cards, which were found on Fury beach, may be most properly attributed to cold, as they were found with the needle pointing north, south, east, and west, and all alike deprived of their magnetic property. The effects of cold on the icebergs was the most striking ; as soon after the thermometer had sunk below zero, icebergs were heard renting and tumbling to pieces with tremendous noise ; and in the spring, these immense masses were seen, like as many mountains after the devastation of an earthquake. It has been supposed that the cold also had the effect of giving the green and blue colour to the ice ; but, although these colours were deeper and more general after than before winter, still I do not think the fact to be sufficiently proved, that the cold is the only cause.

SURGEON'S REPORT.

REPORT

OF

DR. GEORGE M'DIARMID, SURGEON OF THE VICTORY,

ON THE SICK OF THE CREW.

THE following interesting Report of the Sick on board the Victory, was intended for the Narrative; but Dr. M'Diarmid, to whom I am now indebted for it, was unexpectedly appointed to a vessel which was ordered suddenly to India, and sailed before he could prepare it for publication; and he has only returned in time for its insertion in the Appendix. The Report may appear short, as that of so great a length of time, but it is Dr. M'Diarmid's intention to give to the public a fuller account than the prescribed limits of this Appendix could admit of. It has always given me great pleasure to do justice to his uniform zeal and attention, both as regards his profession and other duties; and it has also afforded me much gratification that his conduct has been duly appreciated by the Lords of the Admiralty, who, having dispensed with the usual term of servitude in the Royal Navy, promoted him to the rank, successively, of Assistant-Surgeon and full Surgeon in his Majesty's naval service soon after his return.

JOHN ROSS.

SURGEON'S REPORT.

July 13, 1829.—Our armourer was on this day attacked with pulmonary inflammation; he had, as we subsequently learned, previously suffered from the same malady, and had not been long discharged from one of the London hospitals, when he proffered his services in this expedition. It had been Sir John Ross's intention, soon after the commencement of the voyage, to send him home in one of the whale ships, I having already reported my patient as unfit for further service, but no opportunity presented itself for his return. The poor fellow's case terminated in confirmed consumption, and, although his death was probably in some degree accelerated by the severity of the climate, I think that most likely his disease would have terminated fatally had he remained in England; and I question whether, had he been at home, he could have received more attention, or met with more kindness, even from his relatives, than he experienced at the hands of his shipmates. One wish of his only remained ungratified—he dreaded having his remains deposited in a foreign land, and often expressed vain regrets, that he could not return home to expire on his native soil.

July 27, 1829.—On this day, John Wood, seaman, aged twenty-two, a healthy and robust young man, fractured both the bones of his left leg in jumping into the launch. The cure was completed within two months by ordinary means, nature effecting the union, and the doctor getting the credit of it.

This man was, nine months after his recovery from this accident, severely afflicted with sea-scurvy, and likewise, subsequently in 1833; and as it has been observed, especially by the medical officers attached to Anson's expedition in his Voyage round

the World, that fractures become disunited under the ravages of this malady, I think it proper to observe, that in this instance nothing of the kind occurred, although scorbutic symptoms made their appearance so soon after the fractured bones had become consolidated. The symptoms of his first attack, in 1830, were soon controlled; in 1833, however, the disease assumed a more malignant and violent character, and rapidly attained its worst and most deplorable form: the gums were absorbed almost to the edge of the sockets of the teeth, and had become black and putrid, livid patches appeared on the limbs, the legs became œdematous, and the powers of life were prostrated even to repeated faintings. This melancholy state was rendered still more distressing from the bad quality of the lime juice which we had obtained from the stores of the *Fury*, and which having become decomposed by time, was almost inefficient; yet, in spite of the severity of the disease, and its protracted continuance during a period of four months, I never discovered any indications of disunion in the broken limb. It may, however, be observed, that Lord Anson's men were destitute of all kinds of fresh provisions, and, therefore, not only could not cure, but were unable even to mitigate the progress of the horrible malady which raged among them.

July 24, 1831.—Anthony Buck, aged twenty-four. As this man's case, blindness after epilepsy, is referred to in the Report of the Committee of the House of Commons, it may be, perhaps, interesting to give a short outline of it. In May of this year, he had suffered from snow blindness, which had probably left a disposition to cerebral disease. On the day above mentioned, when on a fishing party seventeen miles from the ship, he had his first attack of epilepsy, from which he recovered with impaired vision of the left eye. On the eleventh of October, he had a second attack still more violent, causing nearly total blindness of both eyes. The fits recurred at irregular intervals for two months, and eventually disappeared, leaving him, however, nearly blind. It cannot be of much interest to trace the various remedies used in this case; but it may be reasonably hoped that the sight may be eventually though gradually recovered; since it is most probable that the blindness depends only on a loss of nervous energy in the retina, from the violence of the fits, a degree of impaired vision being a common consequence of such cases.*

* Since writing the above, I have been told that Buck has partially recovered his sight. Such cases are sometimes fairly referred to organic lesion, but are more usually functional diseases simply.

The second fatal case under my care was one of dropsy (ascites). James Dickson had been on a fishing party two months before the manifestation of dropsical symptoms. He had fallen into the water, and had slept through the night in his wet clothes. His general health from this period was gradually disturbed, and I attribute his malady to the suppressed perspiration consequent upon exposure to damp and cold. On the 20th of October, 1831, he complained of pain and tightness of the abdomen, which, on examination, was found to be swollen and tense. Aperients and diuretics were ordered, as also mercurials to promote the action of the absorbent system, due attention being paid to the function of the skin. I combated the accumulation of fluid with varying success, until the latter end of December, when the tension became extreme, and he was tapped. The operation, as usual, gave him only temporary relief; and, gradually sinking, he died on the 10th of January, 1832.

It is worth while to notice, that at various times during the course of this complaint, symptoms of scurvy made their appearance. So again in Buck's case (epilepsy) the same disease occasionally manifested itself; again in Henry Eyre's case (the cook), who was affected with rheumatism; and in short, in nearly all the cases, the same scorbutic symptoms were mixed up with the proper characteristics of each disease. Even consumption, absolute as it is in our climate, was modified by the same controlling diathesis. The experienced statistical investigator will, in the history of all atmospheric constitutions, observe the same phenomenon in all parts of the world. The cholera epidemic, which stalked like a malignant giant over a great part of the globe, spreading death and desolation in its course, asserted the same controlling influence over disease in general, as has been remarked by most writers on that disease. So again in districts where ague prevails, most diseases receive some additional intermittent character which in other regions do not properly belong to them.

From the experience of former voyagers, and from a consideration of the common causes of scurvy in a northern region, we had sufficiently been taught, that no precaution, however strict, no policy, however comprehensive, could ensure a crew from the occasional ravages of this debilitating malady. The absurdity of attributing it to the single cause of salt provisions, would have been inferior to the pathological views even of the earliest investigators of disease; for the ancients tell us, that not any one cause produces disease, but that is assumed in common parlance as the cause which seems chiefly to have contributed to the effect. Every depressing agent contributes to establish

the scorbutic condition. No wonder, then, that at one period a vexatious confinement with no probable limits, and the most harassing disappointments, hope almost chased away by despair, provisions at times scanty, and a deficiency of all comfortable clothing, should have rendered the constitutions of a great part of our little crew obnoxious to this northern enemy. There were times when the spirits of the crew, like our thermometers, were below zero; and such a condition, conjointly with the causes above mentioned, not only introduced some severe cases, but likewise in a degree baffled our efforts at a cure. The means of prevention were rigidly enforced, and the importance of exercise, by walking, and occasionally dancing, was never lost sight of. Humidity was carefully watched as a known enemy; and to the various ingenious contrivances of former expeditions, an original and successful invention for condensing vapour was superadded. Regular nutritious diet, and plenty of it, should be the rule in serving out the provisions for a northern expedition: we may be disposed to express disgust at witnessing an Esquimaux meal, and indeed nothing can well be more revolting to an European of even ordinary refinement; but let us recollect that the common dietetic rule in the days of Augustan polity was "*semper quamplurimum assumere dummodo hunc concoquat*," and we must leave the savage on a par with the Roman courtier, since they have equally the same limit to the work of refection—the utter impossibility of eating more. Let it be distinctly understood, that I am not advocating gluttony, but merely recording what I believe to be a fact, that very liberal feeding is indispensable to a due generation and preservation of heat in such a climate, and therefore indispensable to the prevention of scurvy.

Seventeen of our crew, in all, were more or less sufferers from this complaint: one only fell a victim to it. So long as we had a store of good lime-juice, good clothing, generous diet, and a favourable condition of cheerfulness, it was not difficult to arrest or control the slighter cases which appeared; but when, in the winter of 1832, and spring of 1833, after deserting the ship, the men had to contend with depression of mind, and a scanty diet (a diet which would have suited a Pythagorean better than a sailor, for we had scarcely any animal food, while our clothing had become almost unserviceable), the development of severe scurvy at once served to heighten our misery, and to show how poor a defence a vegetable regimen (chiefly farinaceous) is, when the causes above named are conjointly exerting their depressing influence.

Here again I may note, that those who were slightly affected at the time they left the ship, were so far benefited by the daily exercise of walking from Victoria harbour to Fury beach, a distance of between two and three hundred miles, that on their arrival at the latter place every man had undergone a spontaneous cure. But it was during our stay at the Fury's stores that the worst form of the disease appeared.

Mr. Chimham Thomas was one of those who had been scorbutic on leaving the ship, and also at various times for two years before. Like several others, he had experienced a spontaneous cure during the journey to the stores, and from July, 1832, to November of the same year, had remained free from the disease; but, under the causes above referred to, his symptoms claimed my notice. On the 12th of November, he was so seriously ill, that with a paucity of all means of controlling the disease, I from the first had apprehensions of the result. There was, indeed, lime-juice found among the Fury's provisions, but seven years had sufficed to render it inert. Neither had I much to expect from exercise; for although it were easy from the commencement to place a sentinel over such a patient on board a man-of-war, admonition was all that in our situation could be had recourse to. We had indeed plenty of good flour, carrots, parsnips, vegetable soup, peas, &c.; but it was impossible to get the men to persist in such food, neither, under the complication of such depressing causes, can it be relied on with any certainty as an antidote. After struggling with the usual appalling symptoms for three months, debilitated by recurrent hæmorrhage from the nose, and his life prolonged by friction, and such excitants as our limited means allowed, a miserable death closed an existence still more miserable. Another case, previously recited (John Wood), promised to be equally severe; but, as it did not occur until March of 1833, he had all the benefit of the warm season, and of a change of diet, which our shooting parties afforded us in the summer months, so that by July he was out of danger.

The other fifteen cases were of various extent, and all did well: and I may here notice, that in all, a disposition to constipation rather than to diarrhœa characterized the disease. It might be supposed that, as scurvy is as familiar to the natives as the snow by which they are surrounded, some new remedy, either external or internal, might have been learned from them. With the direct causes of the complaint they were as conversant as the most learned of us: they say it follows a want of provisions,

and they know well that good living and active exercise are indispensable to the cure. Their sole internal medicine is train oil. This is, in fact, their panacea; and, if it fail, the conjurer is their only refuge.

All northern expeditions have furnished cases of frostbite, or, as we call the milder affections in our own temperate region, chilblains, for they differ only in degree. With due care, these accidents ought not to occur, but to be at all times on our guard is almost impossible. Security is mortals' chiefest enemy, and a long immunity from suffering renders us negligent of danger. In all, we had about a dozen cases. That of George Taylor, one of the mates, demands distinct observation. This poor fellow had gone out with a travelling party, and was at the time about forty miles from the ship. In the morning, he had put on a wet stocking; when on his journey, he felt his foot cold and benumbed, but imprudently persisted in walking without noticing it. In the evening, when ordered by Captain James Ross to put on the usual night-stockings, he discovered that the whole of his foot was frostbitten up to above the ankle. I did not see the case till his return, three days afterwards; Captain James Ross had judiciously ordered the limb to be rubbed with snow, and to be immersed in ice-cold water. On examination I found the foot much swollen, painful, and in a state of incipient gangrene: anodyne poultices were applied, but it soon became necessary to amputate, a measure which the man urged me to delay till Sir John Ross's return, and which I at length performed with a favourable result. The other cases were of minor importance, and all did well.

If the preservation of a uniform temperature by external means be of the highest importance, it must be admitted that the due and vigorous generation of caloric by a proper selection of food is not less so. The natural food of this climate seems well adapted to the purpose. Every one knows that solar caloric, caloric by combustion, and that generated by animal life, are the three chief sources by which our temperature is sustained. Now, it seems but reasonable that in a region where our supply from the two first is so exceedingly limited, the more active evolution from the last source should compensate for the deficiency. It is not so difficult, though certainly far from easy, to explain the laws of heat when exerted on inanimate matter, so as to produce the known vacillations of atmospheric temperature. But to explain these laws as influencing, and influenced by, the laws of vitality—in other words, to show how the affinities of matter

are antagonized by the power of vitality (or that we may not lead our readers to suppose there is any want of harmony in the code of laws by which Divine Providence at once governs the animate and inanimate, we will not say antagonized, but nicely balanced), this indeed has long puzzled, and will still puzzle, philosophers the most acute. There are, however, some facts upon which we can reason with interest and advantage to future navigators; and we have a theory fairly grounded on those facts, which has now withstood the test of nearly half a century, and which has been indeed modified by the careful process of induction from experiments,* but which has never been altogether refuted. To this I deem it my indispensable duty to direct the attention of any of my medical brethren, who may hereafter chance to visit these regions; for what is notoriously said of air in all parts of the world, may here also be said of heat, "we must have it or we die."

To the physiologist, and the general philosopher, my remarks, perhaps, appear commonplace, and certainly not original, but let him bear in mind that they are recorded only as a means of directing my successors to the importance of this subject, and to the necessity of adapting the *victus ratio* accordingly. To proceed then, there are three modes by which heat is probably generated within the body—by the chemical decomposition which takes place in respiration, by the influence of the brain and nervous system, in some degree perhaps analogous to its development by galvanic influence, and by the process of digestion and nutrition.

If it be acknowledged that combustion goes on more rapidly in cold weather, and that this is wisely pre-ordained, the same remark applies to respiration, in which the imaginative poet and the cold philosopher alike recognise the resemblance. The heat generated will partly depend on the rapidity of the union of the impurities of the blood and the consequent liberation of caloric.

But it will partly depend on the quantity of carbon and hydrogen contained, and taken in with the food. On this ground alone, I expect the patience of my readers; for it will follow, if this be admitted, that such provisions should be selected for these expeditions as may have been found to contain these elements in the largest possible

* *Vide* Crawford's Experiments, Spalding on the Diving Bell, and the more recent experiments of Brodie, Phillip, and Le Gallois.

excess, loosely combined, and in the most favourable state for elimination. We all know that articles of an opposite chemical constitution lower the temperature, such as nitre, acids, mineral and vegetable, and hence the failure of lime juice as an antiscorbutic, unless aided by nutritious food. On reference to the food destined by nature for the support of the Esquimaux, we find it almost exclusively hydro-carbonaceous, oil, blubber, fish, and flesh, the two latter of which cannot be too fat for them. Here we see a strong analogy between their process of nutrition and that of combustion; nearly the same materials, the same play of affinities, the same results, the same change of latent into sensible caloric. That persons of a weakly digestion have no great conservative power with regard to temperature, is a matter beyond doubt; and the converse seems equally manifest. It is here we have to regard the felicity of an Esquimaux-constitution, for whatsoever improvement our appetites underwent among them, their inherent digestive powers exceeded ours out of all reasonable proportion.

If I am rightly understood, my readers must see that I contend that the gross diet of northern tribes is not a matter of chance, but in harmony with the slow but constant changes which are continually going on around them; and intended to enable them to resist cold, and to vigorously generate heat. Thus, as we witnessed, the mother was enabled safely to expose her naked infant, but a few days born, to an atmosphere of seventy-five degrees below our freezing point for several minutes; the heat being rapidly generated by the one, and as tenaciously retained by the other, for the child during this time was feeding at the breast. The influence of the nervous system in evolving heat is now generally admitted; its elimination in the process of digestion and nutrition, although not less certain, is still more difficult of explanation.

On a review of the journal of all the cases which came under my care, I can scarcely find room, in the limited space allowed me here, to do more than merely state that pneumonia, colds, simple fevers, and some cases of gastric disease, constituted the chief part of them. Duly considering the various difficulties and privations suffered by the crew, our mortality of three individuals will not be deemed either numerous or extraordinary.

CAPTAIN BACK.

BEFORE this sheet was put to the press, this intrepid and persevering officer arrived in London. It will be recollected, that in the spring of 1833, he volunteered his services in the most praiseworthy and disinterested manner to search for me and my companions, who had then been absent nearly four years. Immediately after our providential return, despatches were sent to him, which he received in May, 1834; and at the same time, directions to continue his survey of Great Slave river, the very existence of which was doubtful, principally with the view of uniting the coast between Cape Turnagain and Commander Ross's furthest beacon. The result of this enterprise has proved that the line of coast to the southward of the Isthmus of Boothia had not been completely examined, and that the information received by Commander Ross from the Esquimaux, making into a bay the land between the isthmus and Matty island, was incorrect; and thus opening a new field for conjecture; but, although it is very probable that the land to the westward of that inlet is an island, I am not of opinion that the western sea joins with Prince Regent's inlet. No one will deny that Captain Back, whose zeal, intelligence, and perseverance, has done so much, will be the fittest person to finish the work he has begun; and I have learnt with peculiar pleasure, that his Majesty, our august sovereign, having dispensed with the term of servitude established by the regulations of the navy to qualify him for the next step, has promoted him to the rank of Captain, as a reward (the most honourable) for his eminent services, and which will render it unnecessary for him to serve on board a ship, before he takes the command of another land expedition, which I hope he will soon undertake by order of government.

I cannot conclude without offering my grateful thanks, to the corporations of London, Hull, the Trinity of Hull, Liverpool, Bristol, and Wicklow, who have each conferred their freedom upon me, as also to the sovereigns of Russia, Prussia, Sweden, Denmark, France, Belgium, and above four thousand individuals, who have presented me with splendid and flattering testimonials of the sense they have entertained of my humble endeavours in the cause of science, but more especially for the kind interest which has been so universally felt for me and my companions.

BIOGRAPHY

OF

THE VICTORY'S CREW.

BIOGRAPHY

OF

THE VICTORY'S CREW.

THIS short Biographical Sketch of the Men, composing the Crew of the Victory, may not be found uninteresting to my Readers.

MR. THOMAS BLANKY, FIRST MATE.

MR. BLANKY was born at Whitby, in the year 1800; is five feet seven inches high, stout made, has a fair complexion, with light hair: went to sea at eleven years of age, and served an apprenticeship of six years in a collier, between Shields and London, on board two vessels, called the Liberty and the Property, after which he was one year in the coasting trade, and two years in the Greenland fishery, on board the Volunteer, of Whitby, where he filled the situation of line manager. He was twelve months in the Swan, revenue cutter, from which he went second mate of the Latona, for one voyage in the timber trade: after making a voyage as second mate of the Lord Wellington to Dantzic, he went two voyages first mate of a collier. In the year 1824 he volunteered to serve on board his Majesty's discovery ship, the Griper, Captain Lyon, and was on board her on that disastrous voyage to Cumberland strait. On her return he entered on board the Navigator, as second mate, and made a voyage to Alexandria; and then as first mate of the Sprightly, to Riga, and two voyages in the coal trade. In 1827 Sir E. Parry's attempt to reach the North Pole was undertaken, and he volunteered on board the Hecla as a leading man; but this attempt being also unsuccessful, he returned to the merchant service, making a voyage to Quebec, and another to St.

Petersburg, as first mate of the *Almira*; after which he joined an uncle as mate, who was master and owner of a schooner, but was wrecked soon after on Flamborough Head. When he joined the *Victory* as first mate, he had been eighteen years at sea, and had become an excellent seaman, of which he gave several remarkable proofs. I may mention that on the morning of the 12th of August, when his presence of mind and decision saved the ship from being thrown into the breakers of a heavy pack of ice. His education having been neglected in his youth, he attended very diligently to instructions given him on the voyage, and became an excellent navigator. Having been before a shipmate of Commander Ross, he naturally attached himself to him, and from whom he received much instruction. Although he was the spokesman on most of the occasions of discontent, particularly on the march from Victoria harbour to Fury beach, I do not blame him so much as those at whose instigation he committed the act of insubordination, and I had no hesitation in giving him my strongest recommendation to A. Chapman, Esq., M.P., who appointed him mate of one of his ships, which led to his obtaining the command of a merchant ship, and which all along seemed to be the sole object of his ambition.

MR. THOMAS ABERNETHY, SECOND MATE.

MR. ABERNETHY was born at Peterhead, in Scotland, in the year 1802, and was nearly six feet high, straight, and well made; had a florid complexion, dark eyes and hair, an aquiline nose, and was decidedly the best-looking man in the ship. He went to sea at the early age of ten, and served an apprenticeship of four years in the *Friends*, of Peterhead, in which he went one voyage to the West Indies, and two to Greenland; afterwards he went three voyages to Davis's straits, in the *Hannibal*; and after which he entered and continued in the coasting, Oporto, and American trade. In 1824 he joined the *Fury*, Captain Hoppner, and was wrecked in Prince Regent's inlet, sharing the hardships of that unfortunate voyage. After making a voyage in a merchant ship, he volunteered his services in the Polar Expedition of 1827, and was one of the most meritorious of Captain Sir Edward Parry's crew: for this, after serving the necessary time on board a ship of the line, he was promoted to the *Blossom* sloop of war, as gunner, and married the daughter of Mr. Fiddis, the carpenter who was with me and Sir E. Parry on all the previous voyages to the Arctic Regions. When he volunteered with me in the *Victory*, he had been seventeen years at sea, and was in my opinion the most steady and

active, as well as the most powerful man in the ship : he was one of those who volunteered to proceed to the westward, on the first journey with Commander Ross. I had no hesitation in recommending him strongly to the Admiralty, and he was accordingly promoted to his Majesty's ship *Seringapatam*, as a reward for his meritorious services.

MR. GEORGE TAYLOR, THIRD MATE.

MR. TAYLOR was born at Lancaster in the year 1800 ; is five feet four inches and a half high ; has blue eyes, brown hair, and a good complexion. He served his apprenticeship of five years to the trade of a ship carpenter, at Ulverston, in Lancashire, in the building-yard of James Hart, Esq. A short period after his time was served, he entered as carpenter of a merchant vessel, and served three years as second mate and carpenter of the *Six Sisters*, of Liverpool, employed in the timber trade, and subsequently in another ship belonging to Hull, before he joined the *Victory* steam-vessel, where I found him doing duty as master when I purchased her at Liverpool. He volunteered in the first instance to carry the vessel to London, where he was employed while the vessel was fitting out, and behaved himself so well that I made him third mate. In 1830, while on a journey with Commander Ross, he got his right foot frostbitten ; and being in the first instance neglected, ended in the amputation of his foot, two inches above the toes, since which he was unable to do any active duty, but was nevertheless very useful. He could walk very little during the remaining three years, and he had often to be carried on the sledge on our march from Victoria harbour to Fary beach. In 1832, on leaving *Batty*, on the 1st of October, we attempted to carry him on the substitute for a sledge, which we made from the staves of casks ; but being quite unable, we were obliged to leave him twice, and I myself returned with the empty sledge to bring him, for which he was always grateful. He was one of the most trusty I had of the crew, and was the person who detected William Light, the steward, purloining my allowance of provisions. When he returned home I provided for him a situation in the Dock-yard, but he preferred going to Liverpool, where his wife and family were, and had been supported by Sir Felix Booth in his absence.

MR. CHIMHAM THOMAS, CARPENTER.

MR. THOMAS was born at Devonport in 1792 ; was five feet three inches high, blue eyes, and sallow complexion. His father was a caulker in his Majesty's Dock-yard at

Plymouth, and he served his apprenticeship of seven years to a shipwright with Mr. Tucker, the master builder. He was employed in His Majesty's Dock-yard until the year 1814, when he volunteered to serve on the *Lakes* in America, assisted in the building of the *St. Lawrence* of one hundred guns, and *Psyche* frigate, and several small vessels—shared in several actions, and returned to England in 1824, after ten years' arduous service. On his homeward passage he suffered shipwreck in the *Mary*, of Liverpool, on the coast of Ayrshire, losing all his hard-earned property. Having entered on board his Majesty's ship *Boadicea*, Commodore Sir James Brisbane, as carpenter's mate, he sailed to the East Indies, where he served two years, during which time he was chiefly at Rangoon, Arrawadda, &c., on board the flotilla opposed to the Burmese; was in several storming parties, and was the next man to Captain Dawson when he was killed attacking a large stockade. In 1826 he was appointed carpenter of the *Slaney*, by Admiral Gage, and from thence to the *Eurydice*, in which ship he returned to England. He volunteered on board the *Victory* in 1829, only the day before she left Woolwich, and was promptly granted leave of absence by the Lords of the Admiralty, to enable him to join. Mr. Thomas was a most excellent workman, and could produce very high testimonials of his character and conduct: but his constitution was worn out by his servitude in the East Indies and America, and could not withstand the severe trials which it was now exposed to, and he sunk under the combined effects of cold and fatigue at the age of thirty-nine years, leaving a widow (to whom he had been only a year married), and a daughter, to deplore his loss.

ALEXANDER BRUNTON, CHIEF ENGINEER.

ALEXANDER BRUNTON was born at Temple, in Midlothian, is five feet four inches high, blue eyes and brown hair, sallow complexion, having much the appearance of a half-worn tradesman. He served his apprenticeship to Mr. Stevenson, the Engineer, at Edinburgh, with whom he continued some time afterwards as a workman; he set up in business for himself at Leith, as a scale-beam and edge-tool maker, but failed, and entered into several steam-vessels as engineer. Having served five years, he came to London; and after working at printing-machine making, for some time, he got into Messrs. Maudslay's manufactory, where he was five years; from thence he went to Messrs. Braithwaite's, and joined the *Victory* in 1829; having been one of those employed in constructing the engine, I considered him a great acquisition, especially as he had a strong recommendation

from his masters ; he had hard work certainly until the 21st of August, as he had almost daily to repair one part or another of the engine ; but it was then given up, and his place was a complete sinecure for some time : he is an excellent but a very slow workman. At Fury beach, he was employed making tin utensils for the officers and men, and it was calculated that each tin-pot he made (taking his high wages into consideration) cost about 1*l*. ! He had no less than 61*l*. 15*s*. to receive when he returned, yet he was not contented, and was one of those who sent a petition to the Admiralty to recover the value of clothes which had been furnished to him to keep him from perishing with cold. When we abandoned the ship, he was one of the most useless. Since his arrival, he has married a widow and set up a “ Gin Palace,” called the “ Crown and Cushion,” in the Borough !

ALLAN MACINNES, SECOND ENGINEER.

ALEXANDER MACINNES was born in the year 1808, at the isle of Mull, in Argyllshire ; he is five feet seven inches high, stout made, of a swarthy complexion, and marked with the smallpox. He was the son of a farmer, but served his apprenticeship, first to a baker, then to an engineer at Gloucester. He had been five years in steam-vessels before he volunteered to the Victory. His situation would also have been a sinecure, after the steam-engine was given up, but he was wanted in his calling as a baker, and was found very useful while at Fury beach, where he made excellent bread. On our return home, he went to see his friends in the North, he returned in spring last, and applied to me for a recommendation to Messrs. Maudslay and Field, which I readily gave him ; but in a few days after he signed the same petition with Brunton to recover the value of clothes, &c., which had been in like manner furnished to him, although he had received 169*l*. 18*s*. 8*d*. of wages, not more than half of which he was entitled to by law, which was an act of ingratitude I did not expect, and of which he has since repented.

JAMES MARSLIN, ARMOURER.

JAMES MARSLIN was born in 1793, at Bristol ; he was five feet seven inches high, sallow complexion, and slight made ; recommended to me by Mr. Blanky, the mate, who had formerly been his shipmate. Until after the ship had sailed, he managed to keep from us that he was labouring under any complaint ; but we had no sooner left the land, than it was discovered that he was in a consumption, and he confessed that he had been discharged from an hospital for that complaint only a few months before ;

he did scarcely any duty, and I had determined on sending him home by the first whaler I could meet with, but unfortunately for him as well as ourselves, we never met with any, and he continued gradually to sink under his complaint, until the 20th of January, when he died, at Felix harbour, and was buried on M'Diarmid's island. His wages (being claimed by two different parties) were paid into the hands of the Accountant-general of his Majesty's Navy. He seemed to be an inoffensive man, and departed this life quite prepared for the great change.

ROBERT SHREEVE, CARPENTER'S MATE.

ROBERT SHREEVE was born in 1806, at Teddington, in Norfolk, is five feet eight inches and a half high, blue eyes, and complexion sallow; is the son of a farmer, and was never before at sea. After being at school in Bury St. Edmond's, he served seven years' apprenticeship to a joiner and house carpenter; he afterwards came to London, and was employed at various places for several years before he came to Mr. Braithwaite's, at New Road; and from whence he volunteered to serve in the Victory. He was a useful person, but had very indifferent health, and was not well calculated for such a service. Having had quite enough of the sea, he declined entering in his Majesty's service, and having received 166*l.* 9*s.* of wages, he set up for himself as carpenter and undertaker.

JOSEPH CURTIS, HARPOONER.

JOSEPH CURTIS was born in the year 1805, at Rotherhithe, is five feet four inches and seven-eighths high, blue eyes, dark complexion, and brown hair; his father was a tailor, and he went to sea at the early age of ten years, having served his time in the coal trade on board the *Flora* and *Nancy* of London. He entered the Davis straits' fishery in the *Eliza* whaler, and was also a voyage to Greenland in the *Everett*; but the most remarkable event of his life, is, his having been on board the *Dundee* whaler of London, when she was frozen up in Davis's strait, and passed the whole of the winter in the ice, during which, the ship's company had three times abandoned the ship, expecting that she would be crushed to pieces by the ice; their sufferings also from hunger and cold were great, but they returned in safety after the insurance had been paid to the owner. Since that event, he had been both in the coasting and timber trade, and came from a steam-vessel to the Victory. He was not a powerful man, and therefore not well calculated for such a service.

as ours, but he was an excellent seaman, and his conduct being uniformly good, I gave him a strong recommendation, and he was sent, by Admiralty order, to the Excellent, to prepare for being made a gunner in the royal navy.

JOHN PARK, SEAMAN.

JOHN PARK was born in 1803, at Bridport, in Dorsetshire, is five feet seven inches high, of a sallow complexion, with light blue eyes. His father, who belonged to the Dock-yard at Portsmouth, had him bound seven years apprentice to a hair-dresser, a trade he did not like, and when his time was out he went to sea in 1821, on board his Majesty's ship *Euryalus*, in which he served three years, when he was paid off, and immediately joined the *Glasgow*; on board of which he also served three years in the Mediterranean. Being asked by me, "What was the most remarkable event in his life?" he answered, that he "had shaved the Duke of Devonshire in a gale on board the *Glasgow*." I then asked, "Were you not on board her at the battle of Navarino?" he replied, "Oh, yes, but that was nothing." His father having lost his life in the American lakes, where he had volunteered to serve, his mother married Mr. More, gunner of the *Tenodos*, who was formerly in the *Hecla*, and who recommended him to me. He was a very active, willing young man, and useful in his calling as a barber, but too delicate in constitution for this service. Being a good seaman, and having always conducted himself well, I gave him a strong recommendation, and he was, with Curtis, sent by Admiralty order to the Excellent, to prepare for a gunner's warrant in the royal navy.

RICHARD WALL, HARPOONER.

RICHARD WALL was born at North Shields, in the year 1803; is five feet five inches and a half high, has small features, blue eyes, and a sallow complexion, with dark hair. He served his apprenticeship of seven years to the sea in the *Mary and Joseph*, in the Madeira, Gibraltar, and coal trade, and after his time was served he went a voyage to Archangel; he was afterwards both in the East India and West India merchant service. His father was a sailor, and having been twenty-three years in the navy, retired as a pensioner. He is an excellent seaman, though not powerful; was one of the best men we had; and in consequence of his good conduct he obtained a good situation in his Majesty's Dock-yard at Deptford.

ANTHONY BUCK, SEAMAN.

ANTHONY BUCK was born in 1807, at Whitby; is five feet seven inches and three-eighths high, slenderly made, strong features, with dark eyes, complexion, and hair. He had been at sea eleven years before he joined the *Victory* in 1829: he was seven voyages in the whale fishery, but latterly in the *Manchester* to the Mediterranean. This man, when he entered, appeared to be in perfect health; but in 1831, while at the river *Lindsay*, he was seized with epilepsy, and it turned out that he had been at the hospital of *Malta* for the same complaint. His entering with us was therefore an act of folly to himself and cruelty to us, which was as unaccountable as inexcusable; he was of course a burden to us ever since he was seized with the first fit, and was very near being numbered among the dead. His father was a sailor in the merchant service, but we did not know of any other relations. He became latterly nearly blind, and he was one of those we had to carry on a sledge after leaving *Fury beach*. Besides his wages, he received a share of a small subscription; but under the circumstances the Admiralty did not entertain his petition for additional remuneration, and he returned to his parish.

JOHN WOOD, SEAMAN.

JOHN WOOD was born in 1809, at *East Wemyss*, in *Fifeshire*: he is five feet seven inches high, stout made, his complexion and hair fair, with blue eyes, and flat broad face. He served four years to the sea in the American trade, sailing from *Kirkaldy*; he was afterwards several voyages in the *West India* and *Quebec* trade, and joined the *Victory* in 1829. In July the same year he broke his leg, by jumping from the ship to the launch to secure her while towing, and we were therefore deprived of his services during the remainder of the outward voyage; and he was never a useful man. He was attacked with scurvy every winter, and was nearly perishing from the effects of that malignant disease at *Fury beach*, from whence we had to carry him on a sledge to *Batty bay*. His constitution was not calculated for such an expedition, or indeed for the sea service; and he retired, after receiving his wages, for which he had done so little, to his friends in the North.

DAVID WOOD, SEAMAN.

DAVID WOOD was born in 1805, in Midlothian; is only five feet two inches and a half high, has a fair and freckled complexion, with light blue eyes. His father was a sailor, who had served long in the navy, and lost his life in his Majesty's service. He served four years apprenticeship out of Kirkaldy, in the Davis straits' trade, on board the Dryad whaler, and went afterwards in the Baltic trade, having been twelve years at sea before he joined the John, where he was in the situation of *Schemer*, the person who has charge of the hold. He did not join the mutineers of that ship, but volunteered for the Victory after it took place, in a very handsome manner. His constitution was delicate, but he was nevertheless a very useful person. He was one of the two who were on the topgallant-yard when the foremast-head gave way, but got down just in time; the other was John Park, who was also saved. David Wood returned to recruit his health in his native climate, and has not since been heard of.

GEORGE BAXTER, ORDINARY SEAMAN.

GEORGE BAXTER was born in 1806, at Kinghorn, in Scotland, where his father kept a public garden; he is five feet six inches and a half high, fair complexion, blue eyes, and light hair. He had never been at sea, and entered on board the John as what is called a *green hand*: he did not join the mutineers of the John, and entered after the mutiny, for which I gave him the rating of an ordinary seaman. His constitution was rather delicate, but latterly he held out well; and on our arrival, after receiving his pay, he returned to his friends, since which he has not made to me any application for employment, which I should consider him entitled to, in consequence of his good conduct.

JAMES DIXON, ORDINARY SEAMAN.

JAMES DIXON was born in 1807, at Tamery, parish of Clanduff, in the county Down; he was five feet eight inches high, and the stoutest man in the ship; he had a florid complexion, with blue eyes and rather dark hair. His father was a sixty-acre farmer, and brought his son up to labour. When about eighteen he went to England as a pack-man, and the whole substance of the family was laid out in Irish linen, which he was to

sell; but he did not succeed, and returned after having lost or spent all, and was at last reduced to sweeping the chimneys of steam-vessels. He entered on board the *John* as a *green hand*, and did not join the mutineers, but entered in the *Victory* after the mutiny. He was one of those whose heart failed him, and after having a severe cold, he fell into a state of despondency, from which he never recovered; having given himself up in despair he wished to die—and from the circumstances under which we were then reduced it was perhaps better that he did not remain long enough to inculcate that feeling among the rest of the crew—he died on the 14th of January, 1832: his wages have been paid into the hands of the Accountant-general, but have not yet been claimed.

BARNARD LAUGHY, ORDINARY SEAMAN.

BARNARD LAUGHY was born at Belfast in the year 1810; he is five feet five inches and a half high, of a sallow complexion, and a little marked with the smallpox; he has blue eyes, brown hair, and has a strong Irish accent. His father was an Irish labourer, who came to Scotland and settled on the estate of Colonel M'Douall, of Logan. He had never been at sea, except in fishing-vessels, but was recommended by Mr. Gibson, factor to Colonel M'Douall as a hard-working lad, who would do to feed the fire of the steam-boiler: his constitution was, however, not calculated for such a voyage, and he was one of those who generally gave out soonest. His conduct was, nevertheless, good; and I procured him a situation in the Coast-guard, which was very acceptable to him, as he managed to lose the whole of his money before he got the length of his father's house.

HENRY EYRE, SHIP'S COOK.

THIS man, who was fifty years of age, was an old sailor; having been formerly cook of the *Griper*, with Captain Hoppner, he made some money, and set up a public-house, which he called "The North Pole." His story was that he was robbed of the money he had laid by to pay his bills, and therefore failed: but he was so addicted to drinking that he could not keep sober, and the receipt of his wages was fatal to him, as he died from intoxication a few days after. He was carried to the grave by his ship-mates, who subscribed for a monument to his memory.

WILLIAM LIGHT, STEWARD.

THIS man was born in 1800, at Medbury, in Devon; he was five feet seven inches high, and by his account had been fourteen years at sea. Having been in two of the former voyages to the Arctic seas, it was considered that he would be an acquisition, and he was entered as steward, in which capacity he had served before; but he turned out to be the very worst subject we had. He was always shamming, or complaining of some pain or other which incapacitated him for any thing but washing; and was therefore excused *harder* duties, and allowed to *wash* linen and *mend* stockings. He was often in the sick list, especially in spring, and was decidedly the most useless person in the ship, as well as the most discontented. This man has been circulating the most scandalous falsehoods, as to my treatment of the crew; and has been furnishing materials for a narrative of the expedition, with which the public have been attempted to be deluded, in the form of numbers, published weekly, and as he possessed no journal or record of the voyage, the greatest part of his pretended narrative is fabulous, and I suspect that the publisher is a considerable loser by the shilling trash. He attended, for some time, at the Panorama in Leicester Square, and amused his hearers with wonderful adventures, in which he always figured as the chief actor, although he was, of all the men on the expedition, the least fond of fatigue or hard work; and instead of his lie in carrying me thirty miles, it was he himself that was carried. In consequence of his unfounded calumnies against me he was dismissed by the proprietor: but as, were I to give his *previous* history, and a true and full account of his conduct during the voyage, I might be supposed to harbour vindictive feelings towards him, I desist in doing so.

It was indeed with great pain I was compelled, conscientiously, to except him from my recommendation of the crew to Government for future employment; but I hope that the good qualities of which he so loudly boasts, will be better appreciated by those with whom he may be hereafter connected.

The interest which this expedition created, will be best expressed by my stating that I could have manned my ship with officers of my own rank, while several offered also to bear a part of the expense, if I would take them on any terms; it was also productive of many curious applications, of which the following is an amusing specimen:

(Copy.)

Gosport, March 31, 1829.

HON. SIR,

Singular it will appear, but true ; three nights following, a person appeared to me in a dream, and said, " Go with Captain Ross, he will be crowned with *success*." And not having the smallest thought of such things before, and reading of dreams having led to great discoveries, I put some confidence in this, and make bold to offer my services, should a man of my description be wanted. I am thirty-eight years old, good constitution, and understand all the undermentioned branches, and have no objection to make myself useful in all to meet satisfaction from my commander : cooking in all its branches ; baking ; butchering ; preserving all kinds of poultry in cases, retaining their proper flavour, dead for any time ; portable soups ; broths ; brawn ; preserved meat of every kind ; game ; stuffing birds, and setting them up in their skins ; preserving, &c. &c. If any of these professions would be of any utility in the voyage, I should be happy to join the expedition. I have been three voyages to the East Indies with one captain now in London, four years and a half in the flag-ship *Victory*—left four days ago at my own request—can produce discharge and certificates to any gentleman's satisfaction, being all the time as cook to the gentlemen on board ; and should you not have ordered your portable soups, it would be a great saving to let me make them : in fact, we can always renew the stock, when we can obtain fresh meat on the voyage. Honoured Sir, you will confer an honour on me by answering these few lines.

Your most humble and obedient servant will be truly thankful,

M. L., Castle Inn, Gosport.

This application would, of course, have been treated as coming from some one who chose to amuse himself, but having met with an officer of the *Victory* who actually knew the man, and gave him an excellent character, and being really in search of a cook, I wrote to him that he might join the expedition under my direction, as cook, if he could produce certificates of his discharge, and if the references to his character were found to justify the account he gave of himself, but that he must lose no time. In answer, I received a note to inform me that I might depend on his joining the ship on Friday ; instead

of him, however, a letter came from his wife, of which the following is a copy, and which closed the transaction.

April 9, 1829.

SIR,

I have just found out that my husband has made an engagement with you to join your expedition, through a dream, *without consulting me*; I must beg to tell you, sir, that he shall not go—I will not let him have his clothes. He must be mad ever to think of leaving a comfortable home, to be frozen in with ice, or torn to pieces with bears; therefore, I am determined he shall not leave Gosport, so I hope you will not expect him.

Yours, Sir, &c., and so forth,

MARY L.

The interest which the expedition excited, was indeed intense; but it was nothing compared to the feeling which was every where roused by our arrival. Subscriptions were proposed, and it was believed that 20,000*l.* might easily have been raised, but Ministers took up the cause so liberally as to induce me to depend solely on them, by, in the first instance, paying the men their *double* wages until the ship was lost, and *full* wages up to the day of their arrival—which was far more than they were entitled to by law under any circumstances—and with this they had every reason to be contented, for in fact they were entitled to nothing after the mutiny of the *John*; they all agreed by acclamation to *run all risks* for the promise of double pay if they succeeded, or *nothing if not*. My nephew Commander Ross, was put on full pay for a year, and then to receive his promotion. Mr. Thom was appointed to the *Canopus*, and the Surgeon made full Surgeon in the navy. And, although the remuneration which I received was small, compared to what I might have had by a subscription, it was sufficient to cover my losses, and to enable me to recover some of my property which had been sacrificed in my absence; however, I had an opportunity of refuting calumnies which had been industriously circulated against me for many years, and, above all, I had the honour of receiving valuable testimonials of high approbation from almost every sovereign in Europe, as well as from our most excellent King.

The subscriptions which were begun in various parts of the kingdom, were discountenanced by me; but, although I did not receive or pocket one farthing of what may have been subscribed, I have reason to believe that the generous public have been imposed upon by those who pretended they were receiving subscriptions for the survivors of the expedition.

METEOROLOGY.

METEOROLOGY being considered of much importance by the scientific world, great attention was paid to this interesting department, which was undertaken by Mr. Thom, whose duty led him to be more constantly on board the ship: the excellent form of a register invented and given to me by Captain Beaufort was adopted, and the men were severally instructed to read off the degrees shown by Fahrenheit's thermometer, which was placed on the ice, in a canvas tent, at a convenient distance from the ship. Its altitude was registered every hour, and at the same time the direction and force of the wind, and the state of the weather, in a manner which will be manifest in the following table, to which directions are prefixed. The first column in the table is the day of the month; the second column is the direction of the wind; the third column is the force of the wind, denoted by figures in the following manner:

- | | | |
|---|---|--|
| 0. Calm. | | |
| 1. Light air, or just sufficient to give steerage way. | | |
| 2. Light breeze | } | or that in which a man-of-war with all sail set, and clean full, would go in smooth water. |
| 3. Gentle breeze | | |
| 4. Moderate breeze | | |
| 5. Fresh breeze | | { Royals. |
| 6. Strong breeze | } | or that which a well-conditioned man of war could carry in chase full and by. |
| 7. Moderate gale | | |
| 8. Fresh gale | | { Single-reefed topsails, and topgallant sails. |
| 9. Strong gale | } | Double-reefed topsails. Triple-reefed topsails. Close-reefed topsails, and courses. |
| 10. A whole gale, or that which scarcely could bear the close-reefed main topsail and foresail. | | |
| 11. A storm, or that which would reduce her to storm staysails. | | |
| 12. A hurricane, or that which no canvas could withstand. | | |

Fourth column denotes the state of the weather by the following letters of the alphabet :

- b—Blue sky ; whether clear or hazy weather.
- c—Clouds ; detached, passing clouds.
- d—Drizzling rain—drift snow in winter.
- f—Foggy. f.—Thick fog.
- g—Gloomy ; dark weather.
- h—Hail.
- l—Lightning.
- m—Misty, hazy atmosphere.
- o—Overcast, or whole sky covered with clouds.
- p—Passing, temporary showers.
- q—Squally.
- r—Rain. r.—Continued rain.
- s—Snow.
- t—Thunder.
- u—Ugly, threatening appearances.
- v—Visible ; clear atmosphere.
- w—Wet dew.

By the combination of these letters all the ordinary phenomena of the weather may be expressed with facility. Examples : 1st, b c m signifies, “Blue sky, with passing clouds, and hazy atmosphere.” 2d, g v, “Gloomy ; dark weather, but distant objects visible.” 3d, q q p d l t t, “Very hard squalls, with passing showers of drizzle, and accompanied with lightning, and with very heavy thunder.”

N.B.—In the following tables the first column expresses the day of the month ; the second the direction of the wind expressed fractionally, thus $\frac{4}{\text{NNW}}$: that is, 4 hours at NNW ; the numerator expressing the number of hours, and the denominator the direction : in like manner the force of the wind, state of the weather, and temperature, are expressed ; the numerator being always hours beginning after midnight.

METEOROLOGICAL OBSERVATIONS OF THE VICTORY DISCOVERY SHIP, TAKEN ON THE ICE, AND REGISTERED HOURLY.

METEOROLOGICAL TABLES.

THE mountain barometer, from which the following observations were registered, was supplied by the Admiralty, and had been on the former voyage. It was constructed by Mr. Jones, of Charing Cross, and the scale graduated to hundreds, and was regularly observed by Mr. Thom.

REMARKS.—By referring to the Explanation at the beginning of the Meteorological Table, this Abstract will be readily understood. Beginning at the 1st of October, 1829, we have taken the six following for winter months, in which it will be manifest that the prevailing winds were north-westerly and next north-easterly, and that south-easterly winds were not only least prevalent but weakest, and that the total average of the wind was much greatest from the northward. The same remark is applicable to the summer months, and to these circumstances must be attributed the constant influx of ice and water to the Gulf of Boothia; added to which, the numerous and large rivers which discharge themselves into it, must consequently occasion and account for the strong current which Sir E. Parry found running to the eastward in Hecla and Fury strait.

ABSTRACT OF METEOROLOGICAL OBSERVATIONS.

REMARKS.—The wind during this winter prevailed from the north-westward, but the north-easterly winds were not so prevalent as during the former winter, the south-westerly winds being the next; this may account for the winter being so severe, as there can be no doubt that the wind came from a colder quarter, since in both this and the preceding summer we found the temperature colder as we approached the Magnetic Pole, which bore then nearly west from Sheriff's harbour. During the summer months the wind was decidedly most prevalent from the northward, particularly during the three latter months, which brought vast quantities of ice into the Gulf.

REMARKS.—During this winter the force of the wind was much greater, particularly in the three last months. On this circumstance our hopes of relief were chiefly founded, as by the constant tempestuous weather the ice was kept in motion until late in the month of March, and being generally from the northward, the ice presented a vast space of huge amorphous hummocks.

DIURNAL VARIATION OF THE MAGNETIC NEEDLE.

THE Diurnal Variation of the Magnetic Needle was a subject which attracted the attention of scientific men about the year 1759, when many experiments were made. Its motion westward was observed to commence about 8 A.M., and continue until 2 P.M., when it became stationary for some time, and afterwards moving gradually back until it attained its first position, its utmost extent of variation being 19' 4". It was also observed that at the time an Aurora Borealis was seen, its variation though irregular, was slowly eastward in the morning and westward in the evening, and in the night suddenly both ways in a very short time. These phenomena were attributed to the power of the sun in *heating* the eastern magnetic properties of the earth in the morning, and those of the western in the evening; this was demonstrated by placing a strong magnet on each side of a compass, so as to keep the needle in the magnetic meridian, and alternately screening the sun from each magnet, it was observed, that when the sun was shining on the eastern magnet only, that the needle moved to the westward. This hypothesis was also corroborated by the fact, that the diurnal variation was observed to be greater in the summer than in the winter at London, as will appear by the following table of the mean diurnal variation for each of the twelve months of the year 1759:

January . . .	7' 8"		July . . .	13' 14"
February . . .	8' 58"		August . . .	12' 19"
March . . .	11' 17"		September . . .	11' 43"
April . . .	12' 2"		October . . .	10' 36"
May . . .	13' 0"		November . . .	8' 9"
June . . .	13' 21"		December . . .	6' 58"

The maximum being in June, and the minimum being in December. Thus the regular diurnal variation was concluded to be occasioned by the heat of the sun, which, however,

did not apply to the irregular variation; it was therefore supposed to be occasioned by some subterraneous heat which was at times unequally diffused. The above account will be sufficient to prove that the discovery of diurnal variation is not of a modern date, but we may pass over the experiments that were made subsequently, since none of them threw any light on the subject, until it attracted the attention of the late Captain Flinders, to whom also the discovery of the deviation of the magnetic needle is due.

On my voyage to the Arctic Regions in 1818, the phenomena of the magnet particularly attracted my attention, and although a paper has been published in the Transactions of the Royal Society, by Captain E. Sabine, the observations therein given are exclusively mine, that gentleman not having been even on board or present when they were made, but copied out of my note-book to which he had access. In both the editions of my narrative of that voyage, I have given, not only the observations themselves, and conclusions drawn from them, but rules for the correction for deviation, which are so simple, that any master of a merchant ship can as easily correct his course for the deviation peculiar to his ship as for the variation of the compass. Nor have these rules been superseded; for although Professor Barlow's ingenious plate has been described as "triumphant," it is by no means infallible, as it must be acknowledged that any alteration in the situation of the iron material on board the ship must affect its accuracy, and it cannot again be rectified without a good opportunity when the ship is at anchor; while it is at any rate a piece of expensive lumber, for which there is not the least necessity, if the easy rules I have given are put in practice.

During my late interesting voyage, I have not only had an opportunity of confirming all my former observations, but of adding many important facts, which our actual approach to the magnetic pole has put us in possession of. My first series of observations were made at Felix harbour, in lat. $69^{\circ} 59'$, long. 92° west, where the variation was found to be $89^{\circ} 45'$ west, and the dip $89^{\circ} 55'$. In order to carry on the observations on diurnal variation, which had been begun to the westward by Sir John Franklin, I was, by the liberality of Sir George Murray, then Colonial Secretary, furnished with several instruments which had been used by that scientific and persevering officer, among them the diurnal variation instrument constructed by Mr. Dolland, from whom I received the necessary instructions to use it. This instrument has already been described by Sir John Franklin, but its microscopes were since altered to make the arc more conveniently read off by them. Nevertheless, it was some time before I could use it to obtain any satisfactory result; my magnetic observatory was built entirely of snow, 200 yards distant from any metallic substance, and marks were put up for placing it in the true magnetic meridian. I soon found that this instrument, which had

never before been put to such a test, required the greatest delicacy in its use. When the needle was nicely suspended by a single fibre of New Zealand flax, I found that it was materially disturbed by the approach of any metallic substance, by any sudden increase or decrease of light, and by alteration in the temperature; if I had a coat with brass buttons, or a watch in my pocket, I saw it move before I was within two yards of it; nor could I take five successive readings at each end of the needle, without observing that the increase of temperature caused by my looking through the microscopes had a considerable effect, and observing to a second was impossible, the needle having a constant tremulous motion. When too dark to observe without a light, I was obliged to take a paper lantern, and even then, when the lighted candle shining through the paper was held for the purpose of reading off the arc, it produced a horizontal motion in the needle, corresponding to the direction and strength of the light. We were now in a position so near the magnetic pole, that the natural or universal magnetic influence was at right angles with a magnetized needle, traversing on a point horizontally, and it was then at liberty to be acted upon by any other influence or power, without restraint, excepting from its friction on that point which was also materially lessened by the power of suspension already described; and by inspection of the Tables for April and May, 1830, it will be seen that it followed the sun, although protected from its rays by a snow hut covered with canvass, and had it been at the time immediately in the vicinity of the magnetic pole, there could be no doubt but it would have followed the sun completely round the compass. Again, it was, during the winter, when every thing magnetic is more sluggish, proved, that it was disturbed by and followed the light of a candle; that it was materially disturbed by a brilliant Aurora Borealis, particularly when that was of a deep red. I have therefore concluded, that light, of whatever kind, has the property of combining with the magnetic influence. Of electricity we had no opportunity of making experiments, there being less electric matter in the Arctic Regions than in any other place, as proved on my first voyage, when the electrometer was never affected by it. My second conclusion is, that metal of any kind will become in some degree magnetized, the microscopes became magnetic in June 1830, and after the brass instrument made by Mr. Dolland became affected, I suspended the needle through a glass barometer tube, and used a paper graduated card, which gave the observation to half a degree, and which, indeed, was as near as its tremulous motion would permit the eye to observe it on a silver arc. My third conclusion is, that it is affected by temperature.

So that my observations made during the first voyage¹⁸ were, in that respect, fully confirmed. The following table will clearly show the different periods on which the Diurnal Variation was greatest and least, as well as under what circumstances the differences took place.

DIP, &c. OF THE MAGNETIC NEEDLE.

I HAVE already mentioned that I was in possession of three dipping needles: one the construction of Mr. T. Jones, one by Mr. Pope, and the last by myself on the plan of Mr. Jennings. The two lastmentioned served to prove the accuracy of the first, which was used by me in the month of May, 1830, where I found the dip, by all three dipping needles, to be eighty-nine degrees and fifty-five minutes; and subsequently, at Padliak or Spence bay, where it was found to be eighty-nine degrees and fifty-six minutes, by six sets of observations taken on the two days which I remained there for the purpose; but the variation of the compass was found to be considerably less, being only sixty-eight degrees and thirty-five minutes west, making a difference of twenty degrees and twenty-five minutes, sufficient to indicate nearly where the Pole must be found. It is, however, but justice to say, that the position assigned to the Magnetic Pole by Commander Ross, was made entirely from his own observations, and if any discrepancies are found, I conceive that they must have proceeded from damage which the needle sustained while in my possession at Padliak; but which, if I may judge from the subsequent observations, was not so great as I at first apprehended.

I had also several observations on the magnetic force during the first year; but these I did not follow up, because it was evident that every winter, the magnetic force of the needle constructed for that purpose, had diminished probably from the severity of the climate: these needles are still in my possession.

The observations which I made on Sound, have so nearly the same result as those made on the preceding voyages, that they need not be detailed here; as also those on the Radiation of Solar Heat, the maximum of which was eighty-four degrees of Fahrenheit, in an ivory-mounted thermometer, suspended between two poles. While opposite to black-painted canvas it rose to ninety degrees.

LATITUDES AND LONGITUDES

LATITUDES AND LONGITUDES.

FROM THE N.E. CAPE TO GULF OF BOOTHIA AND KING WILLIAM IV. SEA.

In the first Alphabetical Table the Latitudes and Longitudes of the new discoveries are given to the nearest minute. The names given by the natives are printed in *italics*, as are also those for which there was not room in the chart for their insertion.

This list will also explain the omissions and the discrepancies between the narrative and the chart, which arose from my unavoidable absence, whilst Commander Ross's narrative was printing; and by the chart having been printed and examined by His Majesty before I had received Commander Ross's narrative. Suffice it to remember, that the names on the chart are correct, and the latitudes and longitudes have been compared by Mr. C. Walker.

The second Alphabetical Table contains the Latitudes and Longitudes of Baffin's Bay, as verified by the observations of this voyage, some of which had been unwarrantably altered in some of the charts subsequently published; and the banks of the *Isabella* and *Alexander*, which had been expunged, have been resurveyed and restored to their places.

The third Table contains the Latitudes and Longitudes of the discoveries of Sir E. Parry, Sir John Franklin, and Captain Beechy, carefully abstracted from their charts by Mr. Charles Walker.

LATITUDES AND LONGITUDES.
